I. INTRODUCTION

On October 15, 2013, Magnolia LNG, LLC (Magnolia LNG) filed an application (Application)\(^1\) with the Office of Fossil Energy (FE) of the Department of Energy (DOE) under section 3 of the Natural Gas Act (NGA)\(^2\) for long-term, multi-contract authorization to export domestically produced liquefied natural gas (LNG) in a volume equivalent to approximately 394.2 billion cubic feet per year (Bcf/yr) of natural gas (1.08 Bcf per day (Bcf/d)), which Magnolia LNG states is approximately 8 million metric tons per annum (mtpa) of LNG. Magnolia LNG seeks authorization to export the LNG by vessel from the proposed Magnolia LNG Terminal, which Magnolia intends to construct, own, and operate near Lake Charles, Louisiana (Project). The proposed Magnolia LNG Terminal (Terminal) will be located in Calcasieu Parish, Louisiana, south of Lake Charles.

Magnolia LNG seeks authorization to export this LNG for a 25-year term from the Project to any country with which the United States does not have a free trade agreement (FTA)\(^3\) requiring national treatment for trade in natural gas, and with which trade is not prohibited by U.S. law or policy (non-FTA countries). Magnolia LNG seeks to export this LNG on its own behalf and as agent for other entities that hold title to the LNG at the time of export. Magnolia LNG requests that this authorization commence on the earlier of the date of first commercial export or 10 years from the date this authorization is issued.

---

\(^1\) Magnolia LNG, LLC, Application for Long-Term Multi-Contract Authorization to Export Liquefied Natural Gas to Non-Free Trade Agreement Nations, FE Docket No. 13-132-LNG (Oct. 15, 2013) [hereinafter Magnolia LNG App.].

\(^2\) The authority to regulate the imports and exports of natural gas, including liquefied natural gas, under section 3 of the NGA (15 U.S.C. § 717b) has been delegated to the Assistant Secretary for FE in Redelegation Order No. 00-006.02 issued on November 12, 2014.

\(^3\) The United States currently has FTAs requiring national treatment for trade in natural gas with Australia, Bahrain, Canada, Chile, Colombia, Dominican Republic, El Salvador, Guatemala, Honduras, Jordan, Mexico, Morocco, Nicaragua, Oman, Panama, Peru, Republic of Korea, and Singapore. FTAs with Israel and Costa Rica do not require national treatment for trade in natural gas.
In issuing this Order, we note that DOE/FE has previously issued two orders authorizing Magnolia LNG to export domestically produced LNG from the proposed Magnolia LNG Terminal to countries with which the United States has, or in the future may enter into, a FTA requiring national treatment for trade in natural gas (FTA countries). Those orders—DOE/FE Order No. 3245 (FE Docket No. 12-183-LNG) and Order No. 3406 (FE Docket No. 13-131-LNG)—each authorized the export of 197.1 Bcf/yr of natural gas (0.54 Bcf/d) to FTA countries.

As Magnolia LNG notes in the Application, its two FTA orders together authorize the same volume of LNG as the non-FTA export volume authorized in this Order (394.2 Bcf/yr), and therefore are not additive to the LNG export volume authorized in this Order. DOE/FE is issuing this Opinion and Order subject to the additional conditions set forth below.

**DOE/FE Proceeding.** On March 24, 2014, DOE/FE published a Notice of Magnolia LNG’s Application in the *Federal Register*. The Notice of Application called on interested persons to submit protests, motions to intervene, notices of intervention, and comments by May 23, 2014. In response, DOE/FE received four comments in support of the Application; one motion to intervene supporting the Application submitted by the American Petroleum Institute (API); and two motions to intervene and protest opposing the Application, submitted by Sierra Club and the American Public Gas Association (APGA), respectively. DOE/FE has considered these filings in its review of Magnolia LNG’s Application. *See infra §§ XI, XII.*

---

4 See supra note 3.
7 Magnolia LNG App. at 2 n.3.
Additionally, in evaluating the public interest under NGA section 3(a), DOE/FE has considered the following economic and environmental studies in its review of Magnolia LNG’s Application:

(1) Economic Studies:

In 2011, DOE/FE engaged the U.S. Energy Information Administration (EIA) and NERA Economic Consulting (NERA) to conduct a two-part study of the economic impacts of U.S. LNG exports, which together was called the “2012 LNG Export Study.” DOE/FE published a notice of availability of the 2012 LNG Export Study in the Federal Register for public comment. The 2012 LNG Export Study is described below (infra § VII.A), and DOE/FE responded to the public comments in connection with the LNG export proceedings identified in that notice. In relevant part, the NERA study projected that, across all scenarios studied—assuming either 6 Bcf/d or 12 Bcf/d of LNG export volumes—the United States would experience net economic benefits from allowing LNG exports.

By May 2014, in light of the volume of LNG exports to non-FTA countries then-authorized by DOE/FE and the number of non-FTA export applications still pending, DOE/FE determined that an updated study was warranted to consider the economic impacts of exporting LNG from the lower-48 states to non-FTA countries. On May 29, 2014, DOE announced plans to undertake new economic studies to gain a better understanding of how potentially higher

---

10 Because there is no natural gas pipeline interconnection between Alaska and the lower 48 states, DOE/FE generally views those LNG export markets as distinct. DOE/FE therefore focuses on LNG exports from the lower-48 states for purposes of determining macroeconomic impacts.

DOE/FE commissioned two new macroeconomic studies. The first, \textit{Effect of Increased Levels of Liquefied Natural Gas Exports on U.S. Energy Markets}, was performed by EIA and published in October 2014 (2014 EIA LNG Export Study or 2014 Study).\footnote{U.S. Energy Information Administration, \textit{Effect of Increased Levels of Liquefied Natural Gas Exports on U.S. Energy Markets} (Oct. 2014), available at: https://www.eia.gov/analysis/requests/fe/pdf/lng.pdf.} The 2014 Study assessed how specified scenarios of increased natural gas exports could affect domestic energy markets. At DOE’s request, this 2014 Study served as an update of EIA’s January 2012 study of LNG export scenarios and used baseline cases from EIA’s 2014 \textit{Annual Energy Outlook} (AEO 2014).\footnote{Each Annual Energy Outlook (AEO) presents EIA’s long-term projections of energy supply, demand, and prices. It is based on results from EIA’s National Energy Modeling System model. \textit{See infra § VI.A.}}

Additional information about the 2014 and 2015 Export Studies is set forth below. See infra §§ VII.B, VII.C, VIII.

On December 29, 2015, DOE/FE published a Notice of Availability of the 2014 and 2015 LNG Export Studies in the Federal Register, and invited public comment on those Studies. DOE received 38 comments in response to the Notice of Availability, of which 14 comments opposed the conclusions in the 2014 and 2015 Studies and/or LNG exports generally, 21 expressed support for the Studies, and three took no position. See infra § VIII.

The grant of export authority in this Order—in a volume of LNG equivalent to 1.08 Bcf/d (394.2 Bcf/yr) of natural gas—brings DOE/FE’s cumulative total of approved non-FTA exports of LNG and compressed natural gas (CNG) to 16.30 Bcf/d of natural gas. Because the 2014 and 2015 Studies examined U.S. LNG exports in excess of 12 Bcf/d, we find it appropriate to review those Studies as part of our public interest review in this proceeding.

(2) Environmental Studies:

On June 4, 2014, DOE/FE issued two notices in the Federal Register proposing to evaluate different environmental aspects of the LNG production and export chain. First, DOE/FE announced that it had conducted a review of existing literature on potential environmental issues associated with unconventional natural gas production in the lower-48 states. The purpose of this review was to provide additional information to the public concerning the potential environmental impacts of unconventional natural gas exploration and production activities, including hydraulic fracturing. DOE/FE published its draft report for public review and comment, entitled Draft Addendum to Environmental Review Documents Concerning

15 U.S. Dep’t of Energy, Macroeconomic Impacts of LNG Exports Studies; Notice of Availability and Request for Comments, 80 Fed. Reg. 81,300, 81,302 (Dec. 29, 2015) [hereinafter Notice of Availability] (providing a 45-day public comment period “to help inform DOE in its public interest determinations of the authorizations sought in the 29 non-FTA export applications identified …”).
Exports of Natural Gas from the United States (Draft Addendum).\textsuperscript{16} DOE/FE received comments on the Draft Addendum and, on August 15, 2014, issued the final Addendum with its response to the public comments contained in Appendix B.\textsuperscript{17}

Second, DOE/FE commissioned the National Energy Technology Laboratory (NETL), a DOE applied research laboratory, to conduct an analysis calculating the life cycle greenhouse gas (GHG) emissions for LNG exported from the United States. See infra § IX.A. The purpose of this analysis was to determine: (i) how domestically-produced LNG exported from the United States compares with regional coal (or other LNG sources) for electric power generation in Europe and Asia from a life cycle GHG perspective, and (ii) how those results compare with natural gas sourced from Russia and delivered to the same markets via pipeline. DOE/FE published NETL’s report entitled, Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas from the United States (LCA GHG Report).\textsuperscript{18} DOE/FE also received public comment on the LCA GHG Report, and provides its response to those comments in this Order. See infra § X.B.

With respect to both the Addendum and the LCA GHG Report, DOE/FE has taken all public comments into consideration in this decision and has made those comments, as well as the underlying studies, part of the record in this proceeding. As explained below, neither the Addendum nor the LCA GHG Report are required by the National Environmental Policy Act of

\textsuperscript{17} Dep’t of Energy, Addendum to Environmental Review Documents Concerning Exports of Natural Gas From the United States, 79 Fed. Reg. 48,132 (Aug. 15, 2014) [hereinafter Addendum]; see also http://energy.gov/fe/addendum-environmental-review-documents-concerning-exports-natural-gas-united-states; infra § VIII.

1969 (NEPA), 42 U.S.C. § 4321 et seq., but DOE/FE believes that these documents will inform its review of the public interest under NGA section 3(a), and are responsive to concerns previously raised in this proceeding.

**Parallel FERC Proceeding.** In April 2014, Magnolia LNG filed an application with FERC in FERC Docket No. CP14-347-000 to site, construct, and operate the Project facilities at the proposed Magnolia LNG Terminal.\(^{19}\) Subsequently, Kinder Morgan Louisiana Pipeline LLC (Kinder Morgan Louisiana) filed a related application with FERC in FERC Docket No. CP14-511-000 for a certificate of public convenience and necessity to construct and operate certain pipeline compression facilities (Lake Charles Expansion Project). According to FERC, the Lake Charles Expansion Project will make Kinder Morgan Louisiana’s existing pipeline facilities bi-directional, enabling it to transport domestically-produced natural gas to the proposed Magnolia LNG Terminal for processing, liquefaction, and export. These two FERC dockets were joined for purposes of FERC review.\(^{20}\)

As detailed below, DOE/FE participated as a cooperating agency in FERC’s environmental review proceeding under NEPA. As part of its environmental review, FERC issued a draft environmental impact statement (EIS) on July 17, 2015,\(^ {21}\) and a final EIS on November 13, 2015.\(^ {22}\) The EIS evaluated the potential environmental impacts of both the Magnolia LNG Liquefaction Project and the Kinder Morgan Louisiana Lake Charles Expansion Projects.

---

\(^{20}\) Federal Energy Regulatory Comm’n, Order Granting Authorization Under Section 3 of the Natural Gas Act and Issuing Certificates, Docket Nos. CP14-347-000 & CP14-511-000, at PP 1-3 (April 15, 2016) [hereinafter FERC Order].

The EIS recommended that FERC subject any approval of these Projects to 114 environmental conditions.24

On April 15, 2016, FERC issued an Order Granting Authorization Under Section 3 of the Natural Gas Act and Issuing Certificates. The FERC Order authorized Magnolia LNG and Kinder Morgan Louisiana to site, construct, and operate their respective Projects subject to 115 conditions (or mitigation measures) contained in the Appendix of the Order. The 115 conditions include the 114 environmental conditions recommended in the EIS, and an additional condition imposed by FERC (Condition #95) pertaining to Magnolia LNG’s commissioning activities.25

Upon review, FERC determined that “most of the direct environmental impacts from the construction of the proposed facilities are expected to be temporary or short term,” and that most other impacts from construction and operation of the facilities “will be reduced to less than significant levels if the projects are constructed and operated in accordance with … the environmental mitigations measures recommended in the EIS and adopted by this order.”26 Details of the FERC Order are discussed below. See infra § XI.C.

Sierra Club timely requested rehearing of FERC’s Order. FERC granted Sierra Club’s request for rehearing for further consideration on June 13, 2016, and subsequently denied the rehearing request on November 23, 2016.27

DOE/FE’s Adoption of the EIS and Issuance of a Record of Decision Under NEPA, and NGA Section 3(a) Authorization. After an independent review, and having been a

23 FERC Order at P 52.
24 See id. at § 5.2 FERC Staff’s Recommended Mitigation.
25 See FERC Order, Appendix at P 95.
26 See id. at P 8.
cooperating agency in the EIS preparation, DOE/FE adopted FERC’s EIS for the proposed Magnolia LNG Liquefaction Project (DOE/EIS-0498), and EPA published a notice of the adoption on September 30, 2016. Concurrently with this Order, DOE/FE is issuing a Record of Decision (ROD) for the proposed Project. As discussed below, this Order grants the Application and is conditioned on Magnolia LNG’s compliance with the 115 environmental conditions adopted in the FERC Order.

II. SUMMARY OF FINDINGS AND CONCLUSIONS

This Order presents DOE/FE’s findings and conclusions on all issues associated with Magnolia LNG’s proposed exports under NGA section 3(a), including both environmental and non-environmental issues. As the basis for this Order, DOE/FE has reviewed a substantial administrative record that includes (but is not limited to) the following: Magnolia LNG’s Application; the non-intervenor comments filed in support of the Application; the motion to intervene filed by API supporting the Application; the motions to intervene and protest filed by Sierra Club and APGA opposing the Application; DOE/FE’s 2014 and 2015 LNG Export Studies; the Addendum; the LCA GHG Report; public comments received on DOE/FE’s various analyses; FERC’s final EIS; and the FERC Order granting authorization for Magnolia LNG to site, construct, and operate the Project.

On the basis of this record, DOE/FE has determined that it has not been shown that Magnolia LNG’s proposed exports will be inconsistent with the public interest, as is required to deny Magnolia LNG’s Application under NGA section 3(a). DOE/FE therefore authorizes

Magnolia LNG’s export of domestically produced LNG from the proposed Magnolia LNG Terminal to non-FTA countries in a total volume equivalent to 394.2 Bcf/yr of natural gas. This authorization is subject to the Terms and Conditions and Ordering Paragraphs set forth herein, which incorporate by reference the 115 environmental conditions imposed by FERC. See infra §§ XIII-XV.

III. PUBLIC INTEREST STANDARD

Section 3(a) of the NGA sets forth the standard for review of the Application:

[N]o person shall export any natural gas from the United States to a foreign country or import any natural gas from a foreign country without first having secured an order of the [Secretary of Energy] authorizing it to do so. The [Secretary] shall issue such order upon application, unless after opportunity for hearing, [he] finds that the proposed exportation or importation will not be consistent with the public interest. The [Secretary] may by [the Secretary’s] order grant such application, in whole or part, with such modification and upon such terms and conditions as the [Secretary] may find necessary or appropriate.

15 U.S.C. § 717b(a). This provision creates a rebuttable presumption that a proposed export of natural gas is in the public interest. DOE/FE must grant such an application unless opponents of the application overcome that presumption by making an affirmative showing of inconsistency with the public interest.31

While section 3(a) establishes a broad public interest standard and a presumption favoring export authorizations, the statute does not define “public interest” or identify criteria that must be considered. In prior decisions, however, DOE/FE has identified a range of factors

---

30 The Secretary’s authority was established by the Department of Energy Organization Act, 42 U.S.C. § 7172, which transferred jurisdiction over imports and export authorizations from the Federal Power Commission to the Secretary of Energy.

that it evaluates when reviewing an application for export authorization. These factors include economic impacts, international impacts, security of natural gas supply, and environmental impacts, among others. To conduct this review, DOE/FE looks to record evidence developed in the application proceeding.\(^\text{32}\)

DOE/FE’s prior decisions have also looked to certain principles established in its 1984 Policy Guidelines.\(^\text{33}\) The goals of the Policy Guidelines are to minimize federal control and involvement in energy markets and to promote a balanced and mixed energy resource system. The Guidelines provide that:

The market, not government, should determine the price and other contract terms of imported [or exported] natural gas …. The federal government’s primary responsibility in authorizing imports [or exports] will be to evaluate the need for the gas and whether the import [or export] arrangement will provide the gas on a competitively priced basis for the duration of the contract while minimizing regulatory impediments to a freely operating market.\(^\text{34}\)

While nominally applicable to natural gas import cases, DOE/FE subsequently held in Order No. 1473 that the same policies should be applied to natural gas export applications.\(^\text{35}\)

In Order No. 1473, DOE/FE stated that it was guided by DOE Delegation Order No. 0204-111. That delegation order, which authorized the Administrator of the Economic Regulatory Administration to exercise the agency’s review authority under NGA section 3, directed the Administrator to regulate exports “based on a consideration of the domestic need for the gas to be exported and such other matters as the Administrator finds in the circumstances of a

\(^{32}\) See, e.g., Sabine Pass, DOE/FE Order No. 2961, at 28-42 (reviewing record evidence in issuing conditional authorization).

\(^{34}\) Id. at 6685.

\(^{35}\) Phillips Alaska Natural Gas, DOE/FE Order No. 1473, at 14 (citing Yukon Pacific Corp., DOE/FE Order No. 350, Order Granting Authorization to Export Liquefied Natural Gas from Alaska, 1 FE ¶ 70,259, at 71,128 (1989)).
particular case to be appropriate.”36 In February 1989, the Assistant Secretary for Fossil Energy
assumed the delegated responsibilities of the Administrator of ERA.37

Although DOE Delegation Order No. 0204-111 is no longer in effect, DOE/FE’s review
of export applications has continued to focus on: (i) the domestic need for the natural gas
proposed to be exported, (ii) whether the proposed exports pose a threat to the security of
domestic natural gas supplies, (iii) whether the arrangement is consistent with DOE/FE’s policy
of promoting market competition, and (iv) any other factors bearing on the public interest
described herein.

IV. DESCRIPTION OF REQUEST

Magnolia LNG requests long-term, multi-contract authorization to export domestically
produced LNG, on its own behalf and as agent for other entities that will hold title to the LNG,
from the proposed Magnolia Project to non-FTA countries in a volume equivalent to 394.2
Bcf/yr of natural gas (1.08 Bcf/d). Magnolia LNG requests this authorization for a 25-year term,
commencing on the earlier of the date of first export or 10 years from the date of the issuance of
this Order.

A. Description of Applicant

Magnolia LNG, LLC is a Delaware limited liability company with its principal place of
business in Houston, Texas. Magnolia LNG is a wholly-owned indirect subsidiary of Liquefied
Natural Gas Limited (LNG Limited). According to Magnolia LNG, LNG Limited is a publicly

36 DOE Delegation Order No. 0204-111, at 1; see also 1984 Policy Guidelines, 49 Fed. Reg. at 6690.
37 See Applications for Authorization to Construct, Operate, or Modify Facilities Used for the Export or Import of
Reg. 11,436 (Mar. 20, 1989)).
listed Australian company formed with the objective of identifying and developing LNG projects overseas and in Australia.\textsuperscript{38}

In a Notice of Change in Control\textsuperscript{39} given effect by DOE/FE,\textsuperscript{40} Magnolia LNG advised DOE/FE of two changes in the equity ownership of its parent company, LNG Limited. First, Magnolia LNG stated that, as of October 10, 2014, the Baupost Group, L.L.C. (Baupost) increased its holdings in LNG Limited’s stock. The transaction raised Baupost’s holdings in LNG Limited from 8.82% to approximately 10.08% of the issued and outstanding shares of LNG Limited. Second, as of May 21, 2014, China Huanqui Contracting & Engineering Corporation (HQ) reduced its holdings in LNG Limited. According to Magnolia LNG, HQ now controls 2.17% of the outstanding shares in LNG Limited. In its Notice, Magnolia LNG asserted that neither Baupost’s increase in holdings nor HQ’s reduction in holdings of LNG Limited will result in any changes, directly or indirectly, in the power to direct the management or policies of either LNG Limited or Magnolia LNG. DOE/FE determined, however, that the Baupost transaction constituted a change of control for purposes of DOE’s CIC Procedures.\textsuperscript{41}

**B. Description of Facility**

Magnolia LNG seeks long-term authorization to export domestically produced LNG from Project facilities to be developed at the Magnolia LNG Terminal, which Magnolia proposes to construct, own, and operate. Magnolia LNG states that the Terminal will be constructed on Industrial Canal South Shore PLC Tract 475, a 120-acre parcel of land located in Calcasieu

\textsuperscript{38} Magnolia LNG App. at 2-3.
\textsuperscript{39} Magnolia LNG, LLC, Description of Recent Equity Ownership Changes, FE Docket Nos. 13-132-LNG, \textit{et al.}, (Dec. 5, 2014).
\textsuperscript{40} U.S. Dep’t of Energy, Magnolia LNG, LLC, Notice of Change in Control, FE Docket Nos. 13-32-LNG, \textit{et al.} (Nov. 4, 2016).
\textsuperscript{41} \textit{See id.} at 4-5.
Parish, Louisiana, south of Lake Charles. Magnolia LNG notes that the Terminal will be located off the main Calcasieu River Ship Channel in an area zoned for heavy industrial use.

Magnolia LNG states that, on March 6, 2013, it secured property from the Port of Lake Charles to construct the Terminal through a lease agreement. Specifically, Magnolia LNG signed an exclusive, binding four-year Real Estate Lease Option Agreement with the Port for the Project site. Magnolia LNG states that, subject to compliance with the terms of the Option Agreement, it may exercise the option and enter into a ground lease with the Port at any time. Magnolia LNG further states that the initial lease term is for 30 years, with Magnolia LNG having the right to extend the lease term, at its sole discretion, for up to four additional 10-year terms, or for 70 years total.

Magnolia LNG states that the Liquefaction Project is anticipated to include four LNG trains, two LNG storage tanks (each with capacity of approximately 160,000 m³), and vessel loading facilities. Each of the LNG trains will be capable of producing up to 2 mtpa of LNG, for a total capacity of 8 mtpa of LNG. According to Magnolia LNG, the Project facilities would receive natural gas by pipeline at the Terminal, liquefy the natural gas, and load the LNG from the storage tanks onto an LNG carrier berthed alongside the Terminal.

Finally, Magnolia LNG states in the Application that, on March 20, 2013, FERC accepted Magnolia LNG’s request to commence the pre-filing process for authorization to site, construct, own, and operate the Terminal. As discussed below, FERC has since conducted an

---

42 The Real Estate Lease Option is attached to Magnolia LNG’s Application as Exhibit B; see also Magnolia LNG App. at 3-4.
43 See id.
44 See id. at 4.
45 See id. at 3.
environmental review of the proposed Terminal under NEPA and granted Magnolia LNG’s authorization. See infra § XI.

C. Procedural History

Pertinent aspects of Magnolia LNG’s procedural history with DOE/FE are summarized below.

FTA Order – DOE/FE Order No. 3245: On February 26, 2013, DOE/FE issued Order No. 3245, in which it authorized Magnolia LNG to export LNG, on its own behalf and as agent for other entities, from the proposed Magnolia LNG Terminal to FTA countries in a volume equivalent to 197.1 Bcf/yr of natural gas (0.54 Bcf/d) for a 25-year period.46

FTA Order – DOE/FE Order No. 3406: On January 5, 2014, DOE/FE issued Order No. 3406, in which it authorized Magnolia LNG to export LNG, on its own behalf and as agent for other entities, from the proposed Magnolia LNG Terminal to FTA countries in a volume equivalent to approximately 197.1 Bcf/yr of natural gas (0.54 Bcf/d) for a 25-year period.47

The volumes authorized for export in these two FTA orders, DOE/FE Order Nos. 3245 and 3406, are additive to one another, for a combined total FTA export volume of 394.2 Bcf/yr of natural gas (1.08 Bcf/d)—the same volume authorized in this Order.

D. Business Model

Magnolia LNG requests authority to export the LNG on its own behalf and as agent for other entities that will hold title to the LNG at the time of export. Magnolia LNG states that it will comply with all DOE/FE requirements for exporters and agents, including registration requirements. Magnolia LNG further states that, when acting as agent, it will register with DOE/FE each LNG title holder for which it seeks to export LNG as agent, and will comply with other registration requirements, as set forth in recent DOE/FE orders.

Magnolia LNG states that the terms and conditions related to the use of the Magnolia LNG Terminal facilities will be set forth in agreements with Project customers. Magnolia LNG anticipates that these agreements will be for terms of up to 25 years in duration and will run concurrently with Magnolia’s export authorization. Magnolia states that it has not yet entered into such agreements, but that it is engaged in commercial negotiations with several potential terminal customers.48

E. Source of Natural Gas

Magnolia LNG states that the Magnolia LNG Terminal will be situated within approximately three miles of four major interstate/intrastate natural gas pipelines owned by Trunkline Gas Company, Kinder Morgan Louisiana Pipeline (KMLP), Gulf South Pipeline Company, LP, and Chevron Pipe Line Company, respectively. Magnolia LNG states that it is in advanced discussions with KMLP to provide the direct connection to the Magnolia LNG Terminal through which feed gas supplies will flow, and for the compression required to transport the feed gas to the terminal. Magnolia LNG states that, through KMLP, its tolling

48 Magnolia LNG App. at 4-5.
customers will be able to directly access multiple interstate natural gas pipelines and storage facilities, thus providing a variety of stable and economical supply options.

According to Magnolia LNG, the sources of natural gas will include conventional and unconventional supplies from various regions, including the Haynesville, Eagle Ford, Barnett, Floyd-Neal/Conasauga, and Marcellus shale plays. Magnolia LNG states that the size of these traditional and emerging natural gas supply sources in close proximity to the Magnolia LNG Terminal will provide its customers with diverse, reliable alternative natural gas supply options.49

V. APPLICANT’S PUBLIC INTEREST ANALYSIS

Magnolia LNG contends that the proposed exports from the Liquefaction Project are consistent with the public interest under section 3(a) of the NGA, 15 U.S.C. 717b(a). Magnolia LNG relies on the following in support of its position: (1) DOE/FE’s 2012 LNG Export Study discussed herein, (2) data from the U.S. Energy Information Administration’s (EIA) Annual Energy Outlook 2013 (AEO 2013)—the most current information available from EIA as of the date of the Application,50 and (3) a study by the Berkeley Research Group (BRG) commissioned by Magnolia LNG and discussed below.51

Magnolia LNG states that no credible evidence has been presented to support the argument that LNG exports will harm the United States. Rather, Magnolia LNG asserts that the Liquefaction Project will create jobs, develop industry, foster continued production of domestic conventional and unconventional natural gas supplies, promote international trade and improve the U.S. balance of trade, and promote strong relationships with strategic international allies. In

49 See id. at 6-7.
51 Magnolia LNG App. at 13-14.
support of the Application, Magnolia LNG addresses the following four factors: (i) domestic need for the natural gas proposed to be exported; (ii) impact on domestic natural gas prices; (iii) domestic energy security and international impacts; and (iv) economic benefits.

Addressing the BRG Study, Magnolia LNG states that BRG is a leading energy market analytics firm that it retained to analyze the impacts of domestic natural gas prices, consumption, production, and trade from Magnolia LNG’s proposed Terminal and other scenarios for higher LNG export and/or natural gas demand levels (BRG Study). Specifically, Magnolia LNG states that BRG designed a baseline “Reference Case” and five additional scenarios, representing various combinations of higher LNG exports and/or higher domestic demand growth than in the Reference Case. Magnolia LNG maintains that the five scenarios set forth in the BRG Study reflect reasonable ranges for low, moderate, and high levels of LNG exports from North America. In Magnolia LNG’s view, the BRG Study supports the conclusion that Magnolia LNG’s proposed exports are not inconsistent with the public interest.

A. Domestic Need for the Proposed Exports

Magnolia LNG notes that, in prior LNG export orders, DOE/FE has analyzed the domestic need for natural gas by comparing domestic supply to domestic demand for natural gas, using the results of the 2012 LNG Export Study.

First, citing the LNG Export Study and EIA’s AEO 2013, Magnolia LNG contends that the United States has an abundant supply of natural gas that is sufficient to meet domestic demand and to support Magnolia LNG’s requested export authorization. According to Magnolia LNG, AEO 2013 shows that domestic natural gas supply—as measured by proved natural gas supply.

---

52 See id. at 9; see also North American Market Impact Study, Berkeley Research Group (Oct. 8, 2013), attached to Magnolia LNG App. as Appendix A).
53 See id. at 10-13.
reserves—has been increasing. Magnolia LNG cites EIA in stating that proved wet natural gas reserves increased by 9.8 percent from 2010 to 2011 (to 348.81 Tcf), while wet gas production only increased by 6 percent to 24.26 Tcf.\textsuperscript{54} Magnolia LNG next cites EIA data showing that proved dry natural gas reserves as of December 31, 2011, reached 334.07 Tcf, while production increased to 23.56 Tcf.\textsuperscript{55}

Turning to projected U.S. natural gas production, Magnolia LNG asserts that the AEO 2013 Reference Case projects dry natural gas production will increase by 1.3 percent per year through 2040, reaching a total of 33.14 Tcf by 2040—an increase of nearly 38 percent over 2012 production levels.

Next, addressing demand, Magnolia LNG states that the proposed LNG exports will have only a “modest” impact on U.S. domestic natural gas demand, and that U.S. natural gas supply will rise to meet any such increase in demand.\textsuperscript{56} Citing the AEO 2013 Reference Case, Magnolia LNG states that total domestic natural gas demand will increase by 0.7 Tcf per year until 2040, at which time the total domestic consumption will reach 29.54 Tcf (approximately 0.81 Bcf/d). Magnolia LNG asserts that the majority of this demand is projected to come from the electric power and industrial sectors.

Magnolia LNG further states that the BRG Study found that, across the five scenarios for higher LNG exports and/or higher U.S. domestic natural gas consumption, the impact on domestic demand is modest compared to the BRG Reference Case.\textsuperscript{57} According to Magnolia LNG, the BRG Study found that, as LNG exports increase across the higher LNG export scenarios, U.S. natural gas demand generally declines relative to the BRG Reference Case due

\textsuperscript{54} See id. at 14 n.24 (citing EIA, U.S. Crude and Natural Gas Proved Reserves, 2011, at Table 9 (Aug. 2013)).
\textsuperscript{55} See id. at 15 (EIA, U.S. Crude and Natural Gas Proved Reserves, 2011, at Table 9 (Aug. 2013)).
\textsuperscript{56} Id. at 16.
\textsuperscript{57} See Magnolia LNG App. at 17.
primarily to price sensitivity in the electric sector relative to other sectors.

Addressing the adequacy of supply as compared to domestic demand for natural gas, Magnolia LNG cites AEO 2013 in stating that U.S. dry natural gas production will exceed consumption by 2019, and that U.S. dry natural gas production alone will exceed total U.S. natural gas consumption by 3.60 trillion cubic feet in 2040. Magnolia also notes that BRG’s conclusion—that increased demand for natural gas will be met by increased supply from low cost shale production—is consistent with both EIA’s data and DOE/FE’s conclusions in recent LNG export orders.58

B. Impact on Domestic Natural Gas Prices

Magnolia LNG asserts that its proposed LNG exports will have a minimal and manageable impact on U.S. natural gas market demand and prices. According to Magnolia LNG, the BRG Study found that the impacts of LNG exports on U.S. natural gas prices and U.S. domestic natural gas demand under all scenarios studied would be minimal. Specifically, “for all scenarios except the compound High LNG/High Demand scenario, which BRG considers unlikely, the results reflect ‘modest market and price impacts that should not raise substantial concerns for natural gas customers.’”59

C. Domestic Energy Security and International Impacts

Magnolia LNG states that the proposed exports will have a minimal effect, if any, on domestic energy security. Rather, in Magnolia LNG’s view, the proposed LNG exports will promote a more robust global market for natural gas. Magnolia LNG points to statements by U.S. Senator Lisa Murkowski (R-AK), Ranking Member of the Senate Committee on Energy and Natural Resources, who stated that the expansion of U.S. LNG exports would, among other

58 Id.
59 Id. at 20-21 & n.46 (citing BRG Study at 14).
geopolitical benefits: (i) provide assistance to several U.S. allies by diversifying their energy supply; (ii) reduce the amount of leverage Russia can exert over Europe through its natural gas pipeline network; and (iii) enhance global resilience to potential turmoil in the Middle East. Magnolia LNG further states that the proposed exports, if authorized, will be consistent with President Obama’s National Export Initiative (NEI), as established by Executive Order on March 11, 2010, and will support other important federal policies.60

D. Economic Benefits

Magnolia LNG maintains that the Liquefaction Project will stimulate the local, state, regional, and national economies through the direct and indirect creation of new jobs, increased economic activity, and tax revenues. In particular, Magnolia LNG states that the construction of the first two liquefaction trains will lead to the direct creation of more than 1,000 construction jobs. When all four liquefaction trains are at full capacity, Magnolia LNG states that the Terminal will provide for the creation of 55 to 60 permanent direct jobs and an additional 175 indirect jobs. Magnolia LNG estimates that the overall capital investment for the first two trains will be approximately $2.2 billion, with a total of approximately $3.7 billion for all four trains.

Magnolia LNG asserts that it will use U.S. companies to supply much of the equipment and materials required in the construction of the Magnolia LNG Terminal. Magnolia LNG also notes that the lease payment that it will make to the Port of Lake Charles over the term of the lease will help stimulate the local economy. Magnolia LNG maintains that it will become an active part of the local community by creating jobs, spurring economic development, and working with local businesses and governing bodies to efficiently export LNG.61

60 See id. at 21-22.  
61 See id. at 23.
On a national level, Magnolia LNG states that the Liquefaction Project will promote the goals of President Obama’s National Export Initiative and the associated “domestic economic growth potential.” Magnolia LNG further states that the proposed exports will help balance the U.S. trade deficit and, as noted above, assist U.S. allies by diversifying their supply options and allowing commercial parties a greater opportunity to freely negotiate trade agreements with their counterparties. For all of these reasons, Magnolia LNG contends that the proposed exports would contribute net benefits to the national, Louisiana, and local economies.

VI. CURRENT PROCEEDING BEFORE DOE/FE

A. Overview

In response to the Notice of Application published in the Federal Register on March 24, 2014, DOE/FE received four comments in support of the Application. These comments were submitted by: (i) William J. Rase III, Executive Director for the Lake Charles Harbor and Terminal District; (ii) Ronnie Johns, Senator for the State of Louisiana, on behalf of the Southwest Louisiana Legislative Delegation; (iii) Randy Roach, Mayor for the City of Lake Charles; and (iv) Dennis Scott, President of the Cameron Parish Policy Jury. No comments were received opposing the Application. Neither APGA nor Sierra Club filed motions to reply in response to the Answer.

DOE/FE also received three timely-filed motions to intervene in this proceeding. API moved to intervene in support of the Application. Sierra Club and APGA moved to

---

62 Id.
63 See id. at 25.
64 In addition to State Senator Johns, this comment was signed by the following members of the Southwest Louisiana Legislative Delegation: State Senator Dan W. Morrish, Speaker of the House Chuck Kleckley, State Representative Mike Danahay; State Representative A.B. Franklin; State Representative Brett Geymann; and State Representative John E. Guinn.
intervene and submitted protests in opposition the Application. Magnolia LNG did not oppose API’s motion to intervene, but filed a consolidated Answer opposing both Sierra Club and AGPA’s motions to intervene and protests.68

B. Non-Intervenor Comments in Support of the Application

The non-intervenor comments submitted in support of Magnolia LNG’s Application describe the benefits that the Liquefaction Project is expected to provide to the State of Louisiana and to the local economy in Southwest Louisiana. State Senator Johns (commenting on behalf of the Southwest Louisiana Legislative Delegation), Mayor Roach, and Mr. Rase each state that the Liquefaction Project will provide significant economic development benefits, including bringing approximately 1000 construction jobs to the region and providing for permanent employment and other economic benefits. Mr. Scott, President of the Calcasieu Parish Policy Jury, submitted a resolution passed by the Parish of Calcasieu on April 17, 2014, in support of the Application. The Resolution states that these expected economic benefits “will positively impact economic growth in Calcasieu Parish and all of Southwest Louisiana,” and notes that numerous public meetings were held in the community to educate both public officials and private citizens about the Liquefaction Project.69

The commenters also address the environmental aspects of the proposed Project, stating that Magnolia LNG’s liquefaction technology will result in significantly less emissions than

66 Sierra Club, Motion to Intervene and Comments in Opposition of Application, FE Docket No. 13-132-LNG (May 23, 2014) [hereinafter Sierra Club Mot.]
67 American Public Gas Ass’n, Motion for Leave to Intervene and Protest Application, FE Docket No. 13-132-LNG (May 23, 2014) [hereinafter APGA Mot.]
68 Magnolia LNG, LLC, Answer in Opposition to the Sierra Club and the American Public Gas Association Motions to Intervene, Protest, and Comments, FE Docket No. 13-132-LNG (June 9, 2014) [hereinafter Magnolia LNG Answer].
69 Comment filed by Mr. Dennis Scott (Resolution).
traditional liquefaction processes and thus will have a reduced environmental impact in the Southwest Louisiana region.

C.  API’s Motion to Intervene and Comments in Support

On May 23, 2014, API timely filed a motion for leave to intervene in this proceeding and comments supporting the Application. API states that it is a national trade association representing more than 600 member companies involved in all aspects of the oil and gas industry in the United States. API states that its members include owners and operators of LNG import and export facilities in the United States and around the world, as well as owners and operators of LNG vessels, global LNG traders, and manufacturers of essential technology and equipment used all along the LNG value chain. API asserts that it and its members, many of whom operate in the U.S. Gulf Coast region, have a direct and immediate interest in this proceeding that cannot be adequately protected by any other party.

API expresses its support of Magnolia LNG’s Application. In particular, API contends that DOE’s 2012 LNG Export Study remains sound, and that, “across all scenarios, the United States stands to gain net economic benefits from allowing LNG exports.”70 Additionally, API maintains that the EIA’s Annual Energy Outlook 2014 (AEO 2014), released in May 2014, supports DOE’s continued approval of LNG exports. API asserts, for example, that a comparison of the AEO 2014 data to the AEO 2011 data used in the 2012 LNG Export Study confirms that LNG exports will benefit the United States, and demonstrates that the projected impact of LNG exports on U.S. natural gas prices is lower than originally predicted.

In support of Magnolia LNG’s Application, API cites a November 2013 study by ICF International that API commissioned entitled, U.S. LNG Exports: State-Level Impacts on Energy

70 API Mot. at 3.
Markets and the Economy (ICF State Study).71 According to API, the ICF Study confirms the conclusions of both AEO 2014 and the 2012 LNG Export Study. For example, API states that the ICF State Study demonstrates that the net effect of U.S. GDP and employment generated by LNG exports is projected to be positive, while having only a moderate impact on U.S. natural gas prices. Focusing on benefits of the proposed Project to the State of Louisiana, API asserts that the ICF State Study found that “by 2035 increased LNG exports could create $16.2 billion in additional state income and create over 74,000 jobs.”72 In sum, API contends that approval of the Magnolia LNG Project will generate both “permanent and durational construction jobs in the state,” thereby helping to reduce unemployment and boosting state income, which API asserts will benefit the national economy as a whole.73

Addressing DOE’s environmental review of Magnolia LNG’s proposed Project, API commends DOE/FE for serving as a “cooperating agency” in FERC’s environmental review process under NEPA. Responding to arguments by critics that the environmental review process should consider impacts associated with shale gas production, API contends that “NEPA does not require a federal agency to consider such speculative and unrelated upstream impacts.”74 API urges DOE to continue adhering to FERC and DOE precedent on the issue of upstream natural gas production activities.

---

72 API Mot. at 6 & n.10.
73 Id. at 6.
74 Id. at 8 & n.13.
D. Sierra Club’s Motion to Intervene, Protest, and Comments

On May 23, 2014, Sierra Club filed a motion to intervene, protest, and comments opposing Magnolia LNG’s Application.75 Sierra Club states that its members live and work throughout the area that will be affected by Magnolia LNG’s Liquefaction Project, including in the domestic natural gas fields that likely will see increased production as a result of the exports.76 Specifically, Sierra Club states that, as of April 2014, it had 2,954 members in Louisiana and 632,604 members overall. Sierra Club states that its members have vital economic, aesthetic, spiritual, personal, and professional interests in the proposed Liquefaction Project.77

1. Alleged Environmental Impacts from the Requested Authorization

Sierra Club states that the Application is not in the public interest and is not supported by adequate environmental and economic analysis. Sierra Club maintains that DOE/FE cannot proceed with Magnolia LNG’s Application until the NEPA process—in particular, the EIS—is completed.78 Sierra Club asserts that the Application itself is silent as to important environmental impacts. Sierra Club argues that, contrary to Magnolia LNG’s contentions, the Project will cause the following three categories of significant environmental harm: (i) the construction and operation of the Terminal and related infrastructure will “directly impact” the local environment, such as water and air quality; (ii) the Liquefaction Project will induce additional natural gas production, primarily from unconventional natural gas sources such as hydraulic fracturing, with associated environmental harms; and (iii) the Project will result in increased natural gas prices and an increase in coal-fired electricity generation, thereby

75 Sierra Club Mot., supra note 66.
76 See id. at 1-2.
77 See id. at 2.
78 See id. at 3.
increasing emissions of greenhouse gases, as well as emissions of conventional and toxic air pollutants.\(^{79}\) Sierra Club argues that the NGA and NEPA, as well as the Endangered Species Act, require DOE/FE to consider Magnolia LNG’s Application in the context in which the propped project will occur.\(^{80}\) Sierra Club contends that DOE/FE’s analysis must not be confined only to the local, direct effects of Magnolia’s Application, but must also consider the “broader constellation” of indirect and cumulative effects of both Magnolia LNG’s proposal, and all other LNG export proposals currently pending before DOE/FE and FERC.\(^{81}\) Sierra Club asserts that this broader backdrop must inform the NEPA alternatives analysis.

Sierra Club further asserts that DOE/FE can best conduct such an analysis by preparing a programmatic EIS that considers the cumulative impacts of all potential future exports from the Magnolia LNG Terminal, plus all other natural gas export proposals currently approved and pending before DOE/FE.\(^{82}\) In support of this position, Sierra Club argues that DOE/FE can only exclude analysis of an event when it is so remote and speculative as to reduce the effective probability of its occurrence to zero.\(^{83}\) Sierra Club further states that it would be a mistake to rely on the 2012 NERA Study’s prediction of export volumes. The NERA Study, according to Sierra Club, understated the market for likely exports by concluding that exports would only occur when the spread between U.S. gas prices and prices in potential foreign markets exceeded the cost of liquefying, transporting, and re-gasifying domestic production. Sierra Club contends that NERA overstated these transaction costs, particularly the costs of exporting from proposed

---

\(^{79}\) Id. at 4.

\(^{80}\) See id. at 4-10.

\(^{81}\) Sierra Club Mot. at 11.

\(^{82}\) See id. at 11-15.

\(^{83}\) See id. at 12 (citations omitted).
West Coast terminals, and ignored the ways in which “take-or-pay” contracts are likely to distort the market.84

Next, Sierra Club argues that NEPA and the NGA require DOE/FE to consider a broad range of alternatives to the Application, including but not limited to: whether DOE/FE should allow LNG exports but on a smaller-scale and a slower time-table; whether the source of exported natural gas should be restricted to certain plays, formations, or regions; whether to delay, deny, or condition exports based upon their effect on the U.S. utility market; and whether to deny export proposals altogether as contrary to the public interest.85

Next, Sierra Club maintains that Magnolia LNG’s proposed exports are inconsistent with the public interest because they will produce significant environmental harm and negative economic consequences that outweigh the proposal’s benefits.86 With regard to economic consequences, Sierra Club contends that the ultimate effect of the Magnolia LNG Liquefaction Project will be an increase in natural gas prices. Sierra Club further contends that the rise in natural gas prices will cause increased prices for domestic consumers, environmentally harmful increases in coal-fired electricity production, and harm to manufacturing industries and the jobs they support.87

Addressing potential environmental impacts, Sierra Club charges that both construction and operation of the proposed Terminal will emit harmful quantities of carbon monoxide, nitrogen oxides, volatile organic chemicals, and GHGs, and also will likely emit harmful sulfur dioxides and particulate matter. Sierra Club asserts that each of these types of emissions will

84 See id. at 13-14.
85 See id. at 16-17.
86 See id. at 18-19.
87 Sierra Club Mot. at 19.
have injurious environmental and health impacts.88 According to Sierra Club, Magnolia LNG’s filings in the FERC proceeding acknowledged these types of releases but provided insufficient discussion of their harmful effects.89

In addition to air emissions, Sierra Club maintains that the proposed project will likely have deleterious environmental impacts on local water quality, fish and wildlife, and other environmental resources. The likely water impacts identified by Sierra Club include the effects of water withdrawals necessary for construction of the terminal expansion and pipeline pressure testing, additional stormwater runoff from the expanded facility, and discharge and suspension or re-suspension of sediment as a result of dredging and ship transits.90

Furthermore, Sierra Club argues that Magnolia LNG’s proposed exports will have environmental impacts greater than the local impacts because the planned exports will induce additional natural gas production in the United States.91 Sierra Club asserts that these impacts are reasonably foreseeable, and that NEPA and the NGA require DOE/FE to consider the effects of this additional production. Sierra Club points out that the 2012 EIA Study projected that 63 percent of natural gas demand created by exports will be met with new production. In the context of this proceeding, Sierra Club states that this data equates to an additional 0.75 Bcf/d of natural gas production.92 Sierra Club observes that, in fact, Magnolia LNG identifies this additional production, and “appears to predict an even greater increase in production in response to exports.”93

---

88 See id. at 21-24.
89 See id. at 21.
90 See id. at 24.
91 See id. at 24-25.
92 See id. at 25.
93 Sierra Club Mot. at 25.
Sierra Club maintains that available tools enable DOE/FE to predict where this increased natural gas production will occur, specifically citing the NEMS model employed by EIA in the 2012 EIA Study. Sierra Club suggests that a model employed by Deloitte Marketpoint, called the “World Gas Model,” is also capable of identifying the geographic region in which additional production will occur.94

Sierra Club asserts that much of the induced production will come from shale gas and other unconventional sources, citing the 2012 EIA Study for EIA’s projection that 72 percent of the increased production will come from shale gas, 13 percent from tight gas, and 8 percent from coalbed sources.95

Sierra Club states that air pollution is emitted during all stages of natural gas production. Sierra Club claims that natural gas production operations emit methane (CH4), volatile organic compounds (VOCs), nitrogen oxides (NOx), sulfur dioxide (SO2), hydrogen sulfide (H2S), particulate matter (PM), and significant quantities of hazardous air pollutants (HAPs) that contribute to cancer risks and other acute public health problems.96

Sierra Club asserts that methane is the dominant pollutant from the oil and gas sector, and that EPA has identified natural gas systems as the largest contributor to anthropogenic methane emissions in the United States. Sierra Club argues that methane is a potent greenhouse gas that substantially contributes to global climate change. According to Sierra Club, the additional production that would be induced in response to Magnolia LNG’s Liquefaction Project could have methane emissions that are even higher than current nationwide estimates. Citing various studies, Sierra Club states that additional production resulting from LNG exports will include a

94 See id. at 27.
95 See id. at 31 n.86 (citing 2012 EIA Study at 11).
96 See id. at 32.
higher proportion of unconventional gas than the current production mix, and argues that these unconventional sources are likely to have higher GHG emissions.97 Sierra Club contends that, at a minimum, DOE/FE must analyze the GHG emissions resulting from increased production if DOE assumes that the nationwide data is representative.

Sierra Club states that the natural gas industry is also a major source of VOCs and NOx. Sierra Club asserts that, as a result of significant VOC and NOx emissions associated with oil and gas development, numerous areas of the country with heavy concentrations of drilling are now suffering from serious ozone problems. Sierra Club identifies the Dallas-Fort Worth area in Texas, the Wyoming Upper Green River Basin, and the Uintah Basin in Northeastern Utah in particular as ozone non-attainment areas where there is a significant concentration of oil and gas production activities. As another example, Sierra Club states that, in 2008, the Colorado Department of Public Health and Environment concluded that the smog-forming emissions from oil and gas operations exceeded vehicle emissions for the entire state. According to Sierra Club, smog pollution harms respiratory systems and has been linked to premature death, heart failure, chronic respiratory damage, and premature aging of the lungs. Sierra Club states that significant ozone pollution also damages plants and ecosystems. Sierra Club asserts that as oil and gas development moves into new areas, particularly as a result of the boom in shale resources, ozone problems are likely to follow. Moreover, Sierra Club charges that VOCs are likely to be co-emitted with HAPs (such as benzene) which are carcinogenic and endocrine disrupters.98

Sierra Club argues that oil and gas production also emits sulfur dioxide, primarily from natural gas processing plants, and that some natural gas in the United States contains hydrogen sulfide. Sierra Club reports that EPA has concluded that the potential for hydrogen sulfide

97 See id. at 35-36.
98 See id. at 37-41.
emissions from the oil and gas industry is “significant.” 99 According to Sierra Club, hydrogen sulfide can be emitted during all stages of development, including exploration, extraction, treatment and storage, transportation, and refining. Sierra Club asserts that, although direct monitoring of hydrogen sulfide emissions is limited, there is evidence that these emissions may be substantial. Sierra Club states that people living near gas wells that have been exposed to hydrogen sulfide have reported eye, nose, and throat irritation, nose bleeds, dizziness, and headaches. Although hydrogen sulfide was originally included in the Clean Air Act’s list of hazardous air pollutants, Sierra Club acknowledges that it has since been removed from the list, but disputes that the removal was appropriate. 100

Sierra Club states that the oil and gas industry is also a major source of PM pollution, which is generated by heavy equipment used to move and level earth during well pad and road construction. According to Sierra Club, PM emissions from the oil and gas industry are leading to significant pollution problems. For example, according to Sierra Club, monitors in Uintah and Duchesne Counties in Utah have repeatedly measured wintertime PM concentrations above federal standards. Sierra Club maintains that these elevated levels of PM have been linked to oil and gas activities in the Uinta Basin. 101

Focusing on Magnolia LNG’s requested authorization, Sierra Club argues that the proposed Liquefaction Project will induce significant production-related air emissions. Specifically, Sierra Club asserts that Magnolia LNG’s proposed exports will induce approximately 433.62 Bcf/yr of new natural gas demand, which will amount to 273.18 Bcf/yr in new natural gas production. Assuming a 1.0 percent leak rate, this new natural gas demand

99 Sierra Club Mot. at 41 (citation omitted).
100 See id. at 41-42 & n.153.
101 See id. at 42-43.
allegedly will be responsible for the incremental emission of 56,821 tons per year (tpy) of methane, 8,290 tpy of VOCs, and 602 tpy of hazardous air pollutants (HAPs).\footnote{See Sierra Club Mot. at 43-44 & Table 1.}

In addition to the air pollution impacts of natural gas production, Sierra Club argues that increased natural gas production will transform the landscape of regions overlying shale gas plays, bringing industrialization to previously rural landscapes and significantly affecting ecosystems, plants, and animals. According to Sierra Club, land use disturbance associated with natural gas development impacts plants and animals through direct habitat loss (where land is cleared for natural gas uses) and indirect habitat loss (where adjacent land loses some of its important characteristics).\footnote{Sierra Club Mot. at 44-45.}

Sierra Club argues that natural gas production also poses risks to ground and surface water. Sierra Club notes that most of the increased production will involve hydraulic fracturing, a process of injecting various chemicals into gas-bearing formations at high pressures to fracture rock and release natural gas. According to Sierra Club, each step of this process presents a risk to water resources. Sierra Club states that hydraulic fracturing requires large quantities of water and that the large water withdrawals could drastically impact aquatic ecosystems and human communities. Sierra Club also contends that hydraulic fracturing poses a serious risk of groundwater contamination from the chemicals added to the drilling mud and fracturing fluid and from naturally occurring chemicals in deeper formations mobilized during the hydraulic fracturing process. Sierra Club asserts that contamination can occur through several methods, including where the well casing fails or where the fractures created through drilling intersect an existing, poorly sealed well. Sierra Club asserts that hydraulic fracturing has resulted in groundwater contamination in at least five documented instances. According to Sierra Club,
EPA has investigated groundwater contamination likely resulting from hydraulic fracturing in Pavillion, Wyoming, and Dimock, Pennsylvania, concluding that surface pits previously used for storage of drilling wastes and produced/flowback waters were a likely source of contamination for shallower waters, while hydraulic fracturing likely explained deeper contamination.\(^{104}\)

Sierra Club states that natural gas production, particularly hydraulic fracturing, produces liquid and solid wastes, including drilling mud, drill cuttings, “flowback” (the fracturing fluid that returns to the surface after the hydraulic fracturing is completed), and produced water (a mixture of water naturally occurring in the shale formation and lingering fracturing fluid). Sierra Club argues that these wastes must be managed and disposed. Sierra Club states that drilling mud, drill cuttings, flowback, and produced water are often stored on site in open pits that can have harmful air emissions, can leach into shallow groundwater, and can fail and result in surface discharges. Sierra Club also notes that flowback and produced water must be disposed offsite, with a common method being underground injection wells. Sierra Club claims that underground injection of hydraulic fracturing wastewater appears to have induced earthquakes in several regions—a phenomenon known as induced seismicity.\(^{105}\)

Sierra Club states that, in addition to the above-described production-related impacts, Magnolia LNG’s export proposal will increase air pollution by increasing the amount of coal used for domestic electricity production. Citing the 2012 EIA Study, Sierra Club states that exports will cause natural gas prices to rise, leading to increased electricity generation from coal. Specifically, Sierra Club maintains that EIA projected that 72 percent of the decrease in natural gas-fired electricity production due to gas exports will be replaced by coal-fired production, which, according to Sierra Club, will increase emissions of both traditional air pollutants and

\(^{104}\) See id. at 47-51.

\(^{105}\) See id. at 53-54.
greenhouse gases.\textsuperscript{106} Sierra Club urges DOE/FE to take a hard look at the change in domestic GHG emissions that would result.\textsuperscript{107}

Additionally, Sierra Club argues that LNG exports will increase greenhouse gas emissions not only domestically but also internationally. Sierra Club contends that a recent study by the International Energy Agency predicts that international trade in LNG will lead many countries to use natural gas in place of renewable energy (instead of displacing fossil fuels), and to increase their levels of energy consumption.\textsuperscript{108} Additionally, Sierra Club claims that the liquefaction, transportation, and regasification process is energy intensive and increases the lifecycle GHG emissions of LNG compared to methods of consumption where the natural gas remains in a gaseous phase. Sierra Club argues that, for these reasons, LNG has little, if any, advantage over coal, and thus it is unlikely LNG exports would reduce global GHG emissions. Moreover, even if imported LNG were to displace other fossil fuels, Sierra Club asserts that the resulting reductions will be much less than those needed to stabilize atmospheric GHG emissions below a “catastrophic level.”\textsuperscript{109} Sierra Club contends that DOE/FE must investigate policy options that would encourage the emissions reductions necessary to avert climate disaster.\textsuperscript{110}

2. Alleged Economic Impacts from the Requested Authorization

Addressing economic consequences, Sierra Club broadly contends that LNG exports will increase domestic natural gas prices which, in turn, “will harm the majority of the American public by decreasing real wages and reducing employment in energy-intensive industries.”\textsuperscript{111}
Focusing on price and supply impacts, Sierra Club asserts that the both the 2012 EIA and NERA Studies understate the extent to which prices for natural gas will increase in response to LNG exports. Sierra Club also criticizes the Berkeley Research Group Report (BRG Report or BRG Study), submitted by Magnolia LNG, for the same reason. According to Sierra Club, the 2012 LNG Export Study and the BRG Report suffer from the following six flaws:

1. Neither EIA nor NERA in the 2012 LNG Export Study, nor the BRG Report, consider the effects of exporting the full volume of natural gas for which U.S. LNG exports have been proposed. Greater volumes of export will lead to greater price increases.113

2. The BRG Report fails to consider the natural gas used by most facilities to run liquefaction equipment. BRG’s reference case and “reference+Magnolia” scenarios incorporate specific LNG terminals. But, as EIA has explained, most terminals will power liquefaction equipment using natural gas, such that the additional demand placed on the domestic gas supply by these terminals will be roughly 110 percent of their export output.114

3. The 2012 EIA and NERA Studies, as well as the BRG Report, fail to consider the rapid rate at which Magnolia LNG and other project applicants propose to bring export capacity online, and as such, they fail to address the potential for price spikes.115

4. NERA and BRG overstate the extent to which price impacts of LNG exports will be self-limiting. For example, once the cost associated with a “take-or-pay” agreement is sunk at the time of terminal construction, it will no longer factor into buyers’ decision-making, reducing the price spread needed for exports of LNG to occur. Additionally, “the mere existence of export capacity will likely raise U.S. prices even when prices are such that no natural gas is in fact exported.”116

5. Although the BRG Report is predicated on the “Gas Pipeline Competition Model” licensed from Robert Brooks & Associates, BRG appears to have reached conclusions regarding exports’ impacts that differ significantly from those of the model’s author.117

113 See id.
114 See id.
115 See id. at 63.
116 Id. at 65.
117 See id.
6. BRG’s analysis differs from EIA’s on several issues, but BRG has not provided a basis for DOE/FE to choose BRG’s conclusions as opposed to EIA’s “impartial and relatively transparent analysis.”

Sierra Club argues that the negative price impacts may not merely analyze the price impacts that Magnolia LNG’s proposal will purportedly cause, but DOE/FE must look at the effect the price impacts will have on the public generally. Sierra Club states that Magnolia LNG’s Application is deficient in this regard.

Specifically, Sierra Club contends that the proposed Liquefaction Project will harm U.S. workers and the domestic economy. Sierra Club acknowledges that some jobs will be created in the natural gas production sector, but argues these jobs will be equaled or outnumbered by jobs lost in other sectors. According to Sierra Club, the most immediate and dramatic economic effect of the exports will be job losses in energy intensive industries, such as manufacturing—which tend to be stable, long-term jobs. Sierra Club contends that the economic benefits of Magnolia LNG’s proposed Liquefaction Project are overstated in the Application.

Referring to its comments submitted to DOE on the NERA Study, Sierra Club maintains that the available evidence shows that Magnolia LNG’s proposed exports will decrease wages and make most U.S. families worse off financially. Even in regions where exports spur additional natural gas production, Sierra Club contends that the resulting temporary growth in jobs likely will lead to long-term economic decline, as the regions suffer from the “resource curse” and” boom-bust” cycle that plague extractive economies. Moreover, Sierra Club contends that LNG exports will promote a regressive transfer of wealth, in contradiction to the Obama

118 Id. at 66.
119 See Sierra Club Mot. at 66.
120 See id. at 66.
121 See id. at 66-69.
122 See id.
Administration’s executive policy. According to Sierra Club, Magnolia neither acknowledges nor discusses these economic harms.\textsuperscript{123}

For these reasons, Sierra Club contends that DOE/FE cannot rely on the 2012 NERA Study’s broad conclusion that the United States will experience net economic benefits from LNG exports. Sierra Club states that this conclusion rests on a forecast of net gross domestic product (GDP) growth. Sierra Club submits that other economic studies—such as a working paper prepared by Purdue University economists Kemal Sarica and Wallace E. Tyner—found that exports would cause a net reduction in GDP.\textsuperscript{124} Sierra Club also maintains that the NERA Study excluded certain factors that would drive down GDP. These excluded factors, according to Sierra Club, include the environmental impacts (and associated costs) of natural gas production, processing, and liquefaction.\textsuperscript{125}

In sum, based on the preceding arguments and Sierra Club’s view that exports of LNG may cause a net decrease in GDP, Sierra Club asserts that DOE/FE cannot rationally approve the Application. If DOE/FE nonetheless approves the Application, Sierra Club argues that DOE/FE must impose rigorous monitoring conditions, to include monitoring of regional and national economic dislocations and disruptions caused by natural gas extraction, national increases in natural gas and electricity prices (and resulting shifts to more polluting fuels), and related environmental impacts.\textsuperscript{126}

E. APGA’s Motion to Intervene and Protest

APGA filed a Motion for Leave to Intervene and Protest on May 23, 2014. APGA is a national non-profit association of publicly-owned natural gas distribution systems, with

\textsuperscript{123} See id. at 66-70.
\textsuperscript{124} See id. at 71 & n.285.
\textsuperscript{125} See id. at 71.
\textsuperscript{126} See id. at 72-73.
approximately 700 members in 36 states. APGA states that its membership covers 950 not-for-profit retail distribution entities that are owned by, and accountable to, the citizens they serve, including municipal gas distribution systems, public utility districts, county districts, and other public agencies that have natural gas distribution facilities. APGA maintains that its members are active participants in the domestic market for natural gas where they secure the supplies of natural gas to serve their end users. APGA states that it has a direct and substantial interest in this proceeding that cannot be adequately represented by any other party.

In protesting the Application, APGA asserts that Magnolia LNG’s request for authority to export domestic LNG to non-FTA countries is inconsistent with the public interest and should be denied. APGA argues that the proposed exports will increase domestic natural gas prices, burdening households and jeopardizing potential growth in the U.S. manufacturing sector, as well as the nation’s transition away from more environmentally damaging fossil fuels.\(^\text{127}\)

APGA first argues that the EIA 2012 Study, conducted as part of DOE’s 2012 LNG Export Study, concluded that LNG exports will increase prices, with higher volumes causing more drastic increases. APGA points out that the NERA Study, also part of DOE’s 2012 LNG Export Study, found that exports would yield net economic benefits but would raise domestic natural gas prices. According to APGA, these price increases would burden the U.S. consumers who can least afford the increase and disadvantage domestic manufacturing. APGA argues that DOE/FE must go beyond the EIA and NERA Studies to consider the tradeoffs entailed by exporting an increasingly valuable U.S. fuel, rather than supporting and enhancing the use of natural gas domestically.\(^\text{128}\) In addressing the Berkley Research Group Study (BRG Study) submitted by Magnolia LNG in support of the Application, APGA further argues that—

\(^{127}\) APGA Mot. at 3.

\(^{128}\) Id. at 3-4.
according to the BRG Study—the effect of granting Magnolia LNG’s proposed exports will be to raise domestic natural gas prices above those prices observed in the BRG Study reference case.\textsuperscript{129}

APGA points out that, as of May 23, 2014, DOE/FE had received 43 applications for LNG export authority to FTA or non-FTA countries. APGA states that the total applied-for export capacity (to both FTA and non-FTA countries) would increase the daily demand for natural gas by roughly 58 percent.\textsuperscript{130} APGA contends that authorization of this large quantity for export will have an impact on natural gas demand, will increase domestic natural gas and electricity prices, will inhibit the United States’ ability to forge a path toward energy independence, and will undermine sustained economic growth in key manufacturing sectors.\textsuperscript{131}

APGA states that the current increased production of natural gas and resulting low prices of natural gas in the United States provides the nation with an unprecedented opportunity to pursue energy independence and sustained economic growth through a manufacturing renaissance grounded in plentiful, low cost natural gas. Price increases due to exports, APGA contends, will both (i) jeopardize the viability of natural gas as a “bridge-fuel” in the transition away from carbon-intensive and otherwise environmentally problematic coal-fired electric generation, and (ii) inhibit efforts to foster natural gas as a major transportation fuel. AGPA claims that these steps are necessary to wean the United States from its historic, high-risk dependence on foreign oil.\textsuperscript{132}

In particular, APGA contends that new environmental regulations will soon force coal retirements, and that future greenhouse gas regulations may cause additional retirements in the

\textsuperscript{129} Id. at 4 n.7 (citing BRG Study at 12-14).
\textsuperscript{130} See id. at 5.
\textsuperscript{131} See id. at 6.
\textsuperscript{132} See id. at 6, 10-15.
future. Sustained low prices for natural gas, according to APGA, will help to keep electricity prices from spiking higher during this transition. A spike in electricity prices, APGA adds, will have adverse rippling effects on the U.S. economy.  

At the same time, APGA contends that Magnolia LNG’s plan to export natural gas will not prove economically viable. APGA believes that economically recoverable domestic natural gas may prove less robust than projected, especially given associated environmental costs and concerns regarding the long-term productivity of shale gas wells. APGA states that foreign alternatives will soon remove the price arbitrage opportunity that Magnolia LNG (and others) seek to take advantage of, as natural gas reserves from shale formations and export capacity expand around the world. According to APGA, as other nations develop their resources and export capacity and as U.S. natural gas prices increase due to the proposed exports, international and domestic prices will converge. This, in turn, will “leav[e] the U.S. with the worst of all worlds, i.e., higher domestic prices that thwart energy independence and that undermine the competitiveness of the manufacturing sector that relies heavily on natural gas as a process fuel.”

F. Magnolia LNG’s Answer to APGA’s and Sierra Club’s Motions to Intervene, Protest, and Comments

On June 9, 2014, Magnolia LNG filed its consolidated Answer to Sierra Club’s and APGA’s motions to intervene and protest. Magnolia LNG asserts that DOE/FE should not grant intervention to Sierra Club or APGA. Magnolia LNG contends that both motions to intervene are “essentially form comments that only loosely relate to the Magnolia LNG Non-FTA Application,” and contain arguments that DOE and FERC already have rejected expressly in

---

133 APGA Mot. at 14.
134 See id. at 4.
135 Id. at 16.
other LNG export proceedings. Magnolia LNG contends that the proposed intervenors should not be permitted to reopen issues that have been resolved in other dockets, and that DOE/FE accordingly should reject their intervention request.

1. Magnolia LNG’s Answer to Sierra Club’s Protest

According to Magnolia LNG, Sierra Club contests the Application based on “recycled arguments” that have been rejected in other proceedings and/or are misapplied here, and thus cannot overcome the rebuttable presumption established under section 3(a) of the NGA. Specifically, Magnolia LNG disputes Sierra Club’s assertion that DOE/FE must prepare a programmatic EIS for all pending applications to export LNG to non-FTA countries. Magnolia LNG counters that the individual applications to export LNG from terminals proposed at sites spread across the United States are not related and are not part of a coordinated federal program. Consequently, Magnolia LNG argues, a programmatic EIS would not be a useful tool even for basic program planning because, for example, DOE cannot identify projects that are likely to be sited and permitted, nor does it have information about the ultimate geographic footprint of the permitting program.

Magnolia LNG also disputes Sierra Club’s argument that NEPA compels DOE to consider alleged upstream environmental impacts as “‘indirect effects’” of the proposed action. Magnolia LNG states that, under the CEQ definition, an indirect effect “must both be (1) caused by the action and (2) reasonably foreseeable.” Citing federal caselaw, Magnolia LNG argues that upstream environmental impacts fail to meet either of these requirements, and therefore do not qualify as “indirect effects” for purposes of NEPA review.

---

136 Magnolia LNG Answer at 4.
137 See id. at 12.
138 Id. at 13 (citing 40 C.F.R. § 1508.8(b)),
139 See id. at 14 (citing 40 C.F.R. § 1508.8(b)).
Magnolia LNG argues that “[t]here is insufficient information about when, where, and to what extent unconventional development will occur for it to be reasonably foreseeable with regard to the Magnolia LNG Terminal.”\textsuperscript{140} According to Magnolia LNG, neither it, DOE, nor the terminal capacity holders can know the origin of the LNG that is ultimately exported because of the interconnected interstate pipeline grid and the fungible nature of natural gas. For these reasons, Magnolia LNG argues that DOE is not required under NEPA to consider the alleged environmental effects of unconventional natural gas production when it considers the Application.\textsuperscript{141}

Finally, Magnolia LNG counters Sierra Club’s argument that the BRG Report understates increases in domestic gas prices associated with LNG exports, and responds to each of the six alleged flaws of the Report, discussed supra § VI.C. For example, Magnolia LNG contends that the BRG Report correctly considered “[t]he appropriate levels of exports for study” to be “the quantities that are likely to be exported from the U.S.”—not the full volume of all proposed exports, since not all export projects are viable.\textsuperscript{142} Magnolia LNG also reasserts its argument that the proposed Liquefaction Project will benefit the local, regional, and the national economies. Magnolia LNG states that Sierra Club’s protest does not present any arguments or new evidence to undermine those claims of economic benefit, and therefore its arguments should be rejected.

\textsuperscript{140} Id at 27-28.  
\textsuperscript{141} See id. at 28.  
\textsuperscript{142} Id. at 28.
2. Magnolia LNG’s Answer to APGA’s Protest

Magnolia LNG disputes APGA’s argument that DOE’s 2012 LNG Export Study relies on “outdated projections” that serve to underestimate domestic demand for natural gas. Magnolia LNG counters that, in LNG export proceedings, DOE/FE updates its analysis to include the most recent EIA data available, and therefore there is no basis to deny the Application based on data used in the 2012 LNG Export Study.

Next, Magnolia LNG asserts that APGA has failed to provide evidence to support many of its arguments. For example, Magnolia LNG states that APGA has not provided a quantitative analysis of the distributional consequences of authorizing exports of LNG at the household level. According to Magnolia LNG, APGA likewise has failed to provide any evidence that the proposed exports will threaten the U.S. transition from coal or will keep the United States dependent on foreign oil. In support of its position, Magnolia LNG points to API’s statements in its motion in this proceeding that “[t]he U.S. has sufficient quantities of natural gas for U.S. residential use and electricity generation, all while allowing expanded U.S. export opportunities, and without harming the U.S. manufacturing sector.”

Finally, Magnolia LNG states that APGA fails to support its allegations concerning impacts to natural gas prices from the proposed exports and also “misses a unique aspect” of the Magnolia LNG Terminal. Magnolia LNG maintains that its proposed Project is designed to serve domestic markets by including facilities to load LNG onto: (i) LNG carriers and barges for domestic marine distribution to other U.S. states and territories and the possibility of LNG bunkering; and (ii) LNG trucks for road distribution to LNG refueling stations in Louisiana and

---

143 Id. at 40.
144 See id. at 42.
145 Id. at 43 (quoting APGA Mot. at 14-15).
the surrounding states. Magnolia LNG argues that, although mid- and small-scale liquefaction projects add to the viability of the network that is needed to make LNG a transportation fuel, the long-term agreements underlying Magnolia LNG’s Application represent the scale of the investment needed to make the domestic distribution network a reality. Magnolia LNG asserts that its Terminal will add in a meaningful way to the infrastructure for which APGA is advocating.

VII. DOE/FE’S LNG EXPORT STUDIES

A. 2012 LNG Export Study

On May 20, 2011, DOE/FE issued Order No. 2961, DOE/FE’s first order conditionally granting a long-term authorization to export LNG produced in the lower-48 states to non-FTA countries.146 By August 2011, with several other non-FTA export applications then pending before it, DOE/FE determined that further study of the economic impacts of LNG exports was warranted to better inform its public interest review under section 3 of the NGA.147 Accordingly, DOE/FE engaged EIA and NERA Economic Consulting to conduct a two-part study of the economic impacts of LNG exports.148

First, in August 2011, DOE/FE requested that EIA assess how prescribed levels of natural gas exports above baseline cases could affect domestic energy markets. Using its National Energy Modeling System (NEMS), EIA examined the impact of two DOE/FE-prescribed levels of assumed LNG exports—equivalent to 6 Bcf/d and 12 Bcf/d of natural gas—

147 DOE/FE stated in Sabine Pass that it “will evaluate the cumulative impact of the [Sabine Pass] authorization and any future authorizations for export authority when considering any subsequent application for such authority.” Id. at 33.
under numerous scenarios and cases based on projections from EIA’s 2011 *Annual Energy Outlook* (AEO 2011), the most recent EIA projections available at that time.\(^{149}\) The new scenarios and cases examined by EIA included a variety of supply, demand, and price outlooks. EIA published its study, *Effect of Increased Natural Gas Exports on Domestic Energy Markets*, in January 2012.\(^{150}\) EIA generally found that LNG exports will lead to higher domestic natural gas prices, increased domestic natural gas production, reduced domestic natural gas consumption, and increased natural gas imports from Canada via pipeline.

Second, DOE contracted with NERA to assess the potential macroeconomic impact of LNG exports by incorporating EIA’s then-forthcoming case study output from the NEMS model into NERA’s general equilibrium model of the U.S. economy. NERA analyzed the potential macroeconomic impacts of LNG exports under a range of global natural gas supply and demand scenarios, including scenarios with unlimited LNG exports. DOE published the NERA Study, *Macroeconomic Impacts of LNG Exports from the United States*, in December 2012 (NERA Study). Among its key findings, NERA projected that the United States would gain net economic benefits from allowing LNG exports. For every market scenario examined, net economic benefits increased as the level of LNG exports increased.

In December 2012, DOE/FE published a Notice of Availability (NOA) of the EIA and NERA studies (collectively, the 2012 LNG Export Study or Study).\(^{151}\) DOE/FE invited public comment on the Study, and stated that its disposition of the then-pending non-FTA LNG export applications would be informed by the Study and the comments received in response thereto.\(^{152}\) DOE/FE received over 188,000 initial comments and over 2,700 reply comments, of which

---

\(^{149}\) The Annual Energy Outlook (AEO) presents long-term projections of energy supply, demand, and prices. It is based on results from EIA’s NEMS model.

\(^{151}\) 77 Fed. Reg. at 73,627.

\(^{152}\) Id. at 73,628.
approximately 800 were unique.153 The comments were posted on the DOE/FE website and entered into the public records of the 15 LNG export proceedings identified in the NOA.154 DOE/FE responded to those public comments in connection with the LNG export proceedings identified in the NOA.155

1. Methodology

DOE/FE asked EIA to evaluate the impact of increased natural gas demand, reflecting possible exports of U.S. natural gas, on domestic energy markets using the modeling analysis presented in AEO 2014 as a starting point. DOE/FE requested an assessment of how specified scenarios of increased exports of LNG from the lower-48 states could affect domestic energy markets, focusing on consumption, production, and prices. At DOE/FE’s request, EIA assumed three LNG export scenarios, including exports of:

- 12 Bcf/d, phased in at a rate of 2 Bcf/d each year beginning in 2015;
- 16 Bcf/d, phased in at a rate of 2 Bcf/d each year beginning in 2015; and
- 20 Bcf/d, phased in at a rate of 2 Bcf/d each year beginning in 2015.

EIA noted that the ramp-up specified by DOE/FE for these scenarios is extremely aggressive and intended to provide results that show an outer envelope of domestic production and consumption responses that might follow from the approval of exports beyond 12 Bcf/d. Accordingly, EIA also included a 20 Bcf/d export scenario, applied to the AEO 2014 Reference case, with a

---

153 Because many comments were nearly identical form letters, DOE/FE organized the initial comments into 399 docket entries, and the reply comments into 375 entries. See [http://www.fossil.energy.gov/programs/gasregulation/authorizations/export_study/export_study_initial_comments.html](http://www.fossil.energy.gov/programs/gasregulation/authorizations/export_study/export_study_initial_comments.html) (Initial Comments – LNG Export Study) & [http://www.fossil.energy.gov/programs/gasregulation/authorizations/export_study/export_study_reply_comments.html](http://www.fossil.energy.gov/programs/gasregulation/authorizations/export_study/export_study_reply_comments.html) (Reply Comments – LNG Export Study).

154 See 77 Fed. Reg. at 73,629 & n.4.

delayed ramp-up to identify the impact of higher LNG exports implemented at a slower pace, referred to as the “Alt 20 Bcf/d scenario.”

DOE/FE requested that EIA consider the above scenarios in the context of baseline cases from EIA’s AEO 2014. These five cases are:

- The AEO 2014 Reference case;
- The High Oil and Gas Resource (HOGR) case, which reflects more optimistic assumptions about domestic natural gas supply than the Reference case;
- The Low Oil and Gas Resource (LOGR) case, which reflects less optimistic assumptions about domestic oil and natural gas supply than the Reference case;
- The High Economic Growth (HEG) case, in which the U.S. gross domestic product grows at an average annual rate 0.4 percentage points higher than in the Reference case, resulting in higher domestic energy demand; and
- The Accelerated Coal and Nuclear Retirements (ACNR) case, in which higher costs for running existing coal and nuclear plants result in accelerated capacity retirements and greater reliance on natural gas to fuel electricity generation than in the Reference case.

Taken together, the four scenarios and five cases presented 16 case scenarios:

EIA used the five AEO 2014 cases described above as the starting point for its analysis and made several changes to represent the export scenarios specified in the study request. EIA exogenously added LNG exports from the lower-48 states in its model runs, using the NEMS model, to reach the targeted LNG export levels.

The Mid-Atlantic and South Atlantic regions were each assumed to host 1 Bcf/d of LNG export capacity, the Pacific region was assumed to host 2 Bcf/d, with all of the remaining Lower 48 states’ export capacity hosted along the Gulf Coast in the West South Central Census division. In addition to the volume of natural gas needed to satisfy the levels of LNG exports defined in the scenarios, a supplemental volume of gas is required in order to liquefy natural gas for export as LNG. EIA assumed that this volume would equal 10 percent of the LNG export volume. The additional natural gas consumed during the liquefaction process is counted as fuel use within the U.S. region where liquefaction occurs.

As in AEO 2014, U.S. natural gas pipeline imports and exports and U.S. LNG imports are endogenously determined in the model. However, LNG exports out of Alaska were set exogenously to the projected level from the corresponding baseline cases.

One further modeling change was applied only in export scenario runs using the Accelerated Coal and Nuclear Retirements case. This case was included in the Study to reflect a baseline with high use of natural gas and low use of coal for electricity generation that is driven by factors other than favorable natural gas supply conditions and low natural gas prices, which are considered in the High Oil and Gas Resource case. In order to represent a situation in which increased coal generation is not an available response to higher domestic natural gas prices, coal-fired generation was not allowed to rise above the Accelerated Coal and Nuclear Retirements case.
baseline level when the DOE/FE export scenarios were implemented.

2. Scope of EIA Study

The EIA Study recognizes that projections of energy markets over a 25-year period are highly uncertain, and that many events—such as supply disruptions, policy changes, and technological breakthroughs—cannot be foreseen. Other acknowledged limitations on the scope of the EIA Study include:

- NEMS is not a world energy model and does not address the interaction between the potential for additional U.S. natural gas exports and developments in world natural gas markets;

- Global natural gas markets are not fully integrated, and their nature could change substantially in response to significant changes in natural gas trading patterns. Future opportunities to profitably export natural gas from the United States depend on the future of global natural gas markets, the inclusion of relevant terms in specific contracts to export natural gas, and the assumptions in the various cases analyzed;

- Given its focus on the domestic energy system, NEMS does not fully account for interactions between energy prices and the global economy that could benefit the U.S. economy; and

- Measures of domestic industrial activity in NEMS are sensitive to both the composition of final U.S. demand and changes in domestic energy prices. However, NEMS does not account for the impact of domestic and global energy price changes on the global utilization pattern for existing manufacturing capacity or the siting of new capacity inside or outside of the United States in energy-intensive industries.

3. Results of the 2014 EIA LNG Export Study

EIA generally found that LNG exports will lead to higher domestic natural gas prices, increased domestic natural gas production, reduced domestic natural gas consumption, and higher levels of economic output (as measured by real gross domestic product or GDP). The impacts of exports, according to EIA, are as follows:
**Increased natural gas prices.** EIA stated that larger export levels would lead to larger domestic price increases. Percentage changes in delivered natural gas prices would be lower than percentage changes in producer prices, particularly for residential and commercial customers.

**Increased natural gas production and supply.** Increased exports would result in increased natural gas production that would satisfy 61 to 84 percent of the increase in natural gas exports, with a minor additional contribution from increased imports from Canada. Across most cases, EIA states that about three-quarters of this increased production would come from shale sources.

**Decreased natural gas consumption.** Due to higher prices, EIA projects a decrease in the volume of natural gas consumed domestically. EIA states that the electric power generation mix would shift toward other generation sources, including coal and renewable fuels. EIA indicates that there also would be a small reduction in natural gas use in all sectors from efficiency improvements and conservation.

**Increased levels of GDP.** EIA states that increased energy production would spur investment, which would more than offset the adverse impact of somewhat higher energy prices. GDP increases would range from 0.05 to 0.17 percent and generally increase with the amount of added LNG exports.

4. **Increased Natural Gas Prices**

EIA found that natural gas prices would increase generally across all of the export scenarios, with the greatest impact during the first 10 years when LNG exports are ramping up. The smallest price change over the baseline occurs in the High Oil and Gas Resource case. The Low Oil and Gas Resource case yields the largest price response.
EIA notes that the percentage changes in producer natural gas prices and delivered prices to customers compared to the AEO 2014 Reference case baseline would vary, but would be relatively modest. Prices paid to producers would increase from 4 to 11 percent under the 12 and 20 Bcf/d scenario, respectively, while prices paid by residential customers would rise even less—from 2 to 5 percent under the 12 and 20 Bcf/d scenarios.

5. Increased Natural Gas Production and Supply

EIA projected that most of the additional natural gas needed for export would be provided by increased domestic production with a minor contribution from increased pipeline imports from Canada. The remaining portion of the increased export volumes would be offset by decreases in consumption resulting from higher prices associated with the increased exports.

6. Decreased Domestic Natural Gas Consumption

EIA projected that greater export levels would lead to decreases in domestic natural gas consumption. This decrease would occur largely within the electric power sector. EIA projected that over the 2015-40 period, the decline in natural gas consumption from electric power generators, on average, contributes from 10 to 18 percent to the levels of natural gas needed for the increased LNG export demands, across all cases and scenarios. The Study noted that the trade-off in natural gas-fired generation and generation from competing fuels varies depending on the case, and generally depends on the generation fuel mix in the base scenarios.

7. Energy-Related Carbon Dioxide Emissions

EIA projected that the use of natural gas to provide energy for added liquefaction, combined with the displacement of natural gas by more carbon-intensive fuels in end-use sectors, causes an increase in U.S. CO2 emissions over the analysis period in most pairings of export scenarios and baselines. The Study noted that the increased use of coal in the electric power
sector and the increased use of liquids in the industrial sector generally result in a net increase in CO₂ emissions. The Study also noted that, despite the CO₂ emission increases projected in the LNG export scenarios, energy-related CO₂ emissions remain below the 2005 level in each year of the projection period across all pairings of scenarios and baselines.

EIA’s analysis did not include the U.S. Environmental Protection Agency’s (EPA) Transport Rule,¹⁵⁶ as it had been vacated at the time, or other proposed EPA rulemakings.¹⁵⁷ EIA also did not analyze global CO₂ emissions or life cycle emissions. DOE looked at these latter issues in a separate analysis—the LCA GHG Report, discussed below in Section IX.

8. Increased End-User Natural Gas and Electricity Delivered Prices

EIA projected increased total end-use energy expenditures across the range of LNG export scenarios and baselines. Implementation of the 12 Bcf/d scenario under Reference case conditions is projected to increase total end-use energy expenditures by $9 billion per year, or 0.6 percent on average, from 2015-2040. For the 20 Bcf/d scenario, total end-use energy expenditures are projected to rise by $18 billion per year, or 1.3 percent on average, from 2015 to 2040. EIA projected that increased end-use expenditures on natural gas account for one-third of additional expenditures.

9. Increased Gross Domestic Product

EIA projected that increased LNG exports leads to higher economic output, as measured by real GDP, as increased energy production spurs investment. This higher economic output is enough to overcome the negative impact of higher domestic energy prices over the projection period. EIA projected that implementing the export scenarios specified for this Study increased

GDP by 0.05 to 0.2 percent over the 2015-2040 period depending on the export scenario. The GDP gains from increasing LNG exports are positive across all cases, although relatively modest.

The Center for Energy Studies at Rice University’s Baker Institute and Oxford Economics (hereinafter, Rice-Oxford) were commissioned by Leonardo Technologies, Inc. (LTI) on behalf of DOE/FE to undertake a scenario-based assessment of the macroeconomic impact of alternative levels of U.S. LNG exports under a range of assumptions concerning U.S. resource endowment, U.S. natural gas demand, and the international market environment—referred to herein as the 2015 Study.

1. Overview of Rice-Oxford’s Findings in the 2015 Study

The key findings of the 2015 Study include the following:

**Rising LNG exports are associated with a net increase in domestic natural gas production.** The 2015 Study finds that the majority of the increase in LNG exports is accommodated by expanded domestic production rather than reductions in domestic demand.

**As exports increase, the spread between U.S. domestic prices and international benchmarks narrows.** In every case, greater LNG exports raise domestic prices and lower prices internationally. The majority of the price movement (in absolute terms) occurs in Asia.

**The overall macroeconomic impacts of higher LNG exports are marginally positive, a result that is robust to alternative assumptions for the U.S. natural gas market.** With external demand for U.S. LNG exports at 20 Bcf/d, the impact of increasing exports from 12 Bcf/d is between 0.03 and 0.07 percent of GDP over the period of 2026–2040, or $7 to $20 billion annually in today’s prices.
An increase in LNG exports from the United States will generate small declines in output at the margin for some energy-intensive, trade-exposed industries. The sectors that appear most exposed are cement, concrete, and glass, but the estimated impact on sector output is very small compared to expected sector growth to 2040.

Negative impacts in energy-intensive sectors are offset by positive impacts elsewhere. Other industries benefit from increasing U.S. LNG exports, especially those that supply the natural gas sector or benefit from the capital expenditures needed to increase production. This includes some energy-intensive sectors and helps offset some of the impact of higher energy prices.

2. Methodology

Rice-Oxford’s analysis in the 2015 Study used a highly specialized, multi-stage modeling approach. First, the Rice World Gas Trade Model (RWGTM) was used to simulate various alternative futures for the global natural gas market.\(^{158}\) These output data were input into the Oxford Economics Global Economic Model (GEM) and Global Industry Model (GIM) to simulate broad macroeconomic and sectors impacts of the various alternative paths for the global natural gas market.

According to Rice-Oxford, the 2015 Study analyzed a wide range of scenarios in order to establish conclusions that are not dependent on any particular set of starting conditions for the U.S. or international natural gas markets. The scenario assumptions fall along two core dimensions. In one dimension, Rice-Oxford considered different U.S. domestic market conditions regarding resources and domestic demand. In the other dimension, Rice-Oxford

\(^{158}\) The Rice World Gas Trade Model is an equilibrium global natural gas model, as described in Annex B of the 2015 LNG Study. The model has 290 regional demand areas that cover countries having 90 percent of the global energy demand, and 140 natural gas resource and production regions modeled on recent authoritative resource estimates.
considered specific circumstances that result in different international demand pull for U.S.-sourced LNG for each domestic scenario. The domestic scenarios were:

- Reference domestic case;
- High Resource Recovery (HRR) case, which reflects a higher level of recoverable resource in the United States;
- Low Resource Recovery (LRR) case, which reflects a lower level of recoverable resource in the United States; and
- High Natural Gas Demand (Hi-D) case, which reflects a higher level of demand in the United States.

The international demand scenarios were:

- Reference international case;
- Global demand for U.S. LNG supports 12 Bcf/d of exports;
- Global demand for U.S. LNG supports 20 Bcf/d of exports but U.S. exports do not exceed 12 Bcf/d;
- Global demand for U.S. LNG supports 20 Bcf/d of exports but U.S. exports do not exceed 20 Bcf/d; and
- Global demand for U.S. LNG supports 20 Bcf/d of exports and U.S. exports are endogenously determined by the RWGTM.

The table below outlines the approach.

In general, when reading the case nomenclature in the table above, Rice-Oxford notes for a case “N1_N2X,” N1 denotes the name of the international demand scenario, N2 denotes the domestic scenario, and X (either 12 or 20 Bcf/d) denotes the level of LNG exports that can occur from the United States based on the scenario. If X is not present, this means that the amount of LNG exports from the United States is fully endogenous to (i.e., internally generated within) the scenario being considered.

3. Natural Gas Market Assumptions across International Demand Scenarios

Rice-Oxford constructed the scenarios of the 2015 Study to show sufficient international market opportunity to support commercially viable LNG exports from the United States in accordance with the volumes indicated in each case. Various assumptions are made about the international natural gas market so as to stimulate investment in the U.S. upstream sector and the commensurate development of LNG export infrastructure. These scenario assumptions primarily
constrain alternative sources of global supply, such as foreign shale production or LNG capacity, to leave more global natural gas demand to be met by U.S. LNG. The Reference, Global Demand for U.S. LNG at 12 Bcf/d (LNG12), and Global Demand for U.S. LNG at 20 Bcf/d (LNG20) international demand scenarios adjust shale resource availability, pipeline, and LNG infrastructure expansion opportunities outside the United States, and natural gas demand in different countries. Table 3 below presents key assumptions used in the 2015 Study.

For U.S. LNG exports to reach 12 to 20 Bcf/d of natural gas, several unlikely developments in the global natural gas market were included in the 2015 Study. For example, accessible global shale resources were limited to 3,542 Tcf in the LNG20 Scenario compared to 8,407 Tcf in the Reference case. Other assumptions in Table 3 are equally drastic, such as assuming no foreign LNG export capacity comes online after 2020. Without significant assumptions of this magnitude, U.S. LNG exports in the Rice World Gas Trade Model would not reach the 12 or 20 Bcf/d export levels.

LNG New Build Capability                     No limits | Limited expansion capabilities in | Only U.S. has expansion capability beyond
4. The Rice World Gas Trade Model

The Rice World Gas Trade Model (or RWGTM) is used in the 2015 Study to investigate how various assumptions about international and domestic demand and resource availability could impact the U.S. natural gas market over the coming decades. The Rice World Gas Trade Model proves and develops resources, constructs and utilizes transportation infrastructure, and calculates prices to equate demands and supplies while maximizing the present value of producer profits within a competitive framework. New capital investments in production and delivery infrastructure thus must earn a minimum return for development to occur. The debt-equity ratio is allowed to differ across different categories of investment, such as proving resources, developing wellhead delivery capability, constructing pipelines, and developing LNG infrastructure. By developing supplies, pipelines, and LNG delivery infrastructure, the Rice World Gas Trade Model provides a framework for examining the effects of different economic and political influences on the global natural gas market within a framework grounded in geologic data and economic theory.
5. The Oxford Global Economic Model and Global Industry Model

Rice-Oxford stated that the Global Economic Model is the world’s leading globally integrated macro model, used by over 100 clients around the world, including finance ministries, leading banks, and blue-chip companies. The Global Economic Model covers 46 countries, including the United States, Canada, the EU, and major emerging markets including China and India. The model provides a rigorous, consistent structure for analysis and forecasting, and allows the implications of alternative global scenarios and policy developments to be analyzed at both the macro and sector level.

The Global Economic Model is an error correction model, a form of a multiple time series model that estimates the speed at which a dependent variable returns to its equilibrium after a shock to one or more independent variables. Rice-Oxford noted that this form of model is useful as estimating both the short and long run effects of variables on the given variable in question. The Global Economic Model exhibits “Keynesian” features in the short run. Factor prices are sticky and output is determined by aggregate demand. In the long-run, its properties are Neoclassical, such that prices adjust fully, the equilibrium is determined by supply factors (productivity, labor and capital), and attempts to raise growth by boosting demand only lead to higher prices.

Linked to the Global Economic Model is the Global Industry Model. This model, based upon standard industrial classifications and updated quarterly, has a detailed breakdown of output by sector across 100 sectors and 67 countries. The model includes a particularly detailed breakdown in the manufacturing sector, covering eight key sectors: metals, chemicals, motor vehicles, engineering and metal goods, electronics and computers, textiles and clothing.
aerospace, and other intermediate goods. The Global Industry Model generates forecasts for both gross output and gross value added (output excluding intermediate consumption).

6. Results of the 2015 LNG Export Study

In the 2015 Study, Rice-Oxford generally found that LNG exports will lead to:

(i) increased domestic natural gas production, (ii) a narrowing of the spread between domestic prices and marginally positive international benchmarks, (iii) macroeconomic impacts, and (iv) small declines in output at the margin for some energy-intensive industries that are offset by positive impacts elsewhere.

Table 4 below indicates the level of U.S. LNG exports in the year 2040 for every case considered. The Rice World Gas Trade Model Reference International and Domestic Scenario (Ref_Ref case) has 6.38 Bcf/d of U.S. LNG exports in 2040. With the Reference International Demand Scenario and different Domestic Scenarios, U.S. LNG exports range from 5.20 Bcf/d to 6.74 Bcf/d.\textsuperscript{159}

\textsuperscript{159} Additional explanation of the Ref_Ref case is provided in the 2015 LNG Export Study. The Study explains that, although U.S. LNG exports increase in the Ref_Ref case, the impact of U.S. LNG exports and other global supply developments on international domestic prices ultimately places a check on the total volume of U.S. LNG exports. Specifically, the price spreads in the international marketplace weaken to the point that full cost recovery of U.S. LNG export facilities currently under construction is compromised for about a decade. Although those facilities operate during that time period, further investment in LNG export capacity is stymied until global demand expands to stimulate new capital flows into the U.S. LNG export value chain. See 2015 LNG Export Study at 41.

* The level of exports in these cases is the same as in the “U.S. LNG Exports Endogenous” cases.

The impacts of exports, according to Rice-Oxford, included:

**Increase in domestic natural gas production.** The 2015 Study found that the majority of the increase in LNG exports is accommodated by expanded domestic production rather than reductions in domestic demand. Domestic production continues to increase through the time horizon when LNG export volumes can expand to 20 Bcf/d of natural gas, rising 4 percent on average from 2026-2040.

**As exports increase, the spread between U.S. domestic prices and international benchmarks narrows.** In every case, greater LNG exports raise domestic prices and lower prices internationally. The majority of the price movement (in absolute terms) occurs in Asia. The Japan Korea Marker (JKM) price declines in dollar terms by an amount that is roughly six times greater than the price increase at Henry Hub in the United States. Rice-Oxford states that
this is the result of the international market conditions that are simulated in the LNG20 cases. Additionally, the LNG demand stimulus is primarily the result of highly constrained supply potentials plus higher demand in Asia. Although shale potential is also constrained in Europe in the LNG20 cases, the change relative to the Reference international case is small compared to the change in Asia.

**Marginally positive overall macroeconomic impacts.** This result is robust to alternative assumptions for the U.S. natural gas market. With external demand for domestically produced LNG exports at 20 Bcf/d of natural gas, the impact of increasing exports in excess of 12 Bcf/d is between 0.03 and 0.07 percent of GDP from 2026-2040, or $7 to $20 billion annually in today’s prices. The 2015 Study detailed several key drivers of the macroeconomic impacts:

- **U.S. LNG Production and Investment:** When U.S. LNG exports rise to 20 Bcf/d from 12 Bcf/d, natural gas production is 4.0 percent higher in the domestic Reference case. This is associated with a rise in net fuel exports of just 0.02 percent of GDP over the period 2026–2040 and additional investment of 0.06 percent of GDP. There are positive multipliers from the extra production and investment, as activity is stimulated in the rest of the economy, and as a result total output is 0.1 percent higher from 2026–2040.

- **U.S. Natural Gas Prices:** The Henry Hub price is, on average, 4.3 percent higher in the 20 Bcf/d export case than the 12 Bcf/d case over the period 2026–2040. As noted above, higher gas prices dampen domestic consumption and erode U.S. export competitiveness. In total, higher prices reduce GDP by 0.1 percent from 2026–2040.

- **U.S. Profits:** Profits in the 20 Bcf/d export case are higher given the rise in prices, production and export volumes, but the scale of the impact is small relative to the size of GDP. Profits are 0.03 percent of GDP higher in the 20 Bcf/d case compared with the 12 Bcf/d case. The rise in profit is also modest because it is assumed U.S. producers receive the Henry Hub price on LNG exports rather than the price in the destination market. It assumed that 95 percent of profits are distributed to households and this results in a marginal increase in consumption and GDP from 2026–2040.

- **Rest of World Natural Gas Production and Investment:** Production in the rest of the world is little changed when U.S. LNG exports increase to 20 Bcf/d from 12 Bcf/d. Due to the Study’s scenario assumptions, international demand conditions
remain unchanged, and the addition of incremental U.S. LNG exports displaces very little supply from the rest of the world. As a result, capital expenditures by the natural gas sector in the rest of the world remain broadly unchanged when the United States increases LNG exports.

- **Rest of World Natural Gas Prices:** The increase in the availability of cheaper U.S. natural gas exports on the world market dampens natural gas price increases in Asia, though prices in Europe are little affected. The marginal decline in natural gas prices both boosts real income in the rest of the world—which boosts demand and is positive for U.S. exports—and boosts the competitiveness of Asian firms relative to U.S. companies, which is negative for U.S. exports. However, the small impact on gas prices and the relative unimportance of natural gas to total energy supply in Asia means that the impact on consumption in Asia is limited as is the competitiveness boost enjoyed by Asian firms from lower natural gas prices. As a result, the overall impact on U.S. GDP is limited.

**Small declines in output at the margin for some energy-intensive, trade-exposed industries.** The sectors that appear most exposed are cement, concrete, and glass, but the estimated impact on sector output is very small compared to expected sector growth to 2040.

**Negative impacts in energy-intensive sectors are offset by positive impacts elsewhere.** Other industries benefit from increasing U.S. LNG exports, especially those that supply the natural gas sector and/or benefit from the capital expenditures needed to increase production. This includes some energy-intensive sectors and helps offset some of the impact of higher energy prices.

**VIII. COMMENTS ON THE 2014 AND 2015 LNG EXPORT STUDIES AND DOE/FE ANALYSIS**

DOE/FE published the Notice of Availability of the 2014 and 2015 LNG Export Studies in the *Federal Register* on December 29, 2015, seeking public comment on both studies. DOE/FE specifically invited comment on:

[T]he potential impact of LNG exports on domestic energy consumption, production, and prices; the macroeconomic factors identified in the two studies, including Gross Domestic Product, consumption, U.S. economic sector analysis, and U.S. LNG export
feasibility analysis; and any other factors included in the analyses.\textsuperscript{160}

DOE noted that, “[w]hile this invitation to comment covers a broad range of issues, the Department may disregard comments that are not germane to the present inquiry.”\textsuperscript{161}

DOE/FE has reviewed the 38 comments submitted in response to the NOA. Of those, 14 comments opposed the two Studies and/or exports of LNG, 21 supported the Studies, and three took no position. Below, DOE/FE summarizes: (i) the pertinent arguments by topic, with reference to representative comments, and (ii) DOE/FE’s basis for the conclusions that it drew in reviewing those comments. In so doing, DOE/FE has responded to the relevant, significant issues raised by the commenters.\textsuperscript{162}

A. Data Inputs and Estimates of Natural Gas Demand

1. Comments

Several commenters, including Sierra Club, the Industrial Energy Consumers of America (IECA), Cascadia Wildlands, Wim de Vriend, and Hair on Fire Oregon, challenge the data used as inputs to the LNG Export Studies.\textsuperscript{163} Specifically, these commenters assert that the 2015 LNG Export Study relies on inaccurate assumptions that fail to reflect “current conditions” adversely affecting the viability of exporting domestically produced LNG from the United States. Citing various articles and natural gas industry reports, these commenters point to the following conditions—some of which they acknowledge arose after the 2015 LNG Export Study was published:

\textsuperscript{160} 80 Fed. Reg. at 81,302.
\textsuperscript{161} Id.
\textsuperscript{162} See, e.g., Public Citizen v. F.A.A., 988 F.2d 186, 197 (D.C. Cir. 1993).
\textsuperscript{163} Unless specifically noted, the comments address the 2015 LNG Export Study.
• An oversupplied global energy market due to the rapid expansion worldwide of LNG terminals (“supply glut”), which commenters allege will be the status quo for years to come;
• The drop in international oil prices, which allegedly has reduced or eliminated the price advantage for U.S. LNG exports;
• The difference in costs between greenfield and brownfield LNG projects and the associated risks to capital, given the alleged uncertainties associated with LNG exports;
• The declining costs of and advances in renewable energy sources, which allegedly will compete directly with U.S. LNG in end markets;
• Japan’s re-starting of some of its nuclear power plants;
• The increasing prevalence of carbon trading regimes internationally (e.g., China), making natural gas less of a viable energy source; and
• China’s slowing economy.

According to Sierra Club and other commenters, these conditions undermine the assumptions and constraints of the 2015 LNG Export Study, calling into question the Study’s conclusions that LNG exports will provide a slight benefit to GDP. Sierra Club further contends that, in light of these changing conditions, DOE should have revisited the 2012 LNG Export Study, rather than conducting new studies to analyze the marginal effects of higher LNG export volumes.

2. DOE/FE Analysis

We note that the 2015 LNG Export Study modeled a wide range of possible future supply and demand conditions, including alternative assumptions for domestic resource availability, domestic natural gas demand, and a range of international supply and demand conditions that generate different potential market pull for U.S. LNG exports. The 2015 Study scenarios were constructed so there was sufficient international demand to support commercially viable LNG export flows from the United States in accordance with the volumes indicated in each case. This approach allowed Rice-Oxford to assess the macroeconomic impacts of increased levels of U.S. LNG exports under global market conditions where that trade would occur. The 2015 LNG
Export Study found that “the overall macroeconomic impacts of higher LNG exports are marginally positive, a result that is robust to alternative assumptions for the U.S. natural gas market.” That is, the macroeconomic results are similar across the different scenarios examined. The energy market conditions noted by the commenters would, all else being equal, reduce international demand for U.S. LNG exports. The 2014 LNG Export Study included cases with levels of U.S. LNG exports below 20 Bcf/d, specifically 12 and 16 Bcf/d. The 2014 LNG Export Study found that “GDP gains from increasing LNG exports are positive across all cases, although relatively modest.”

We also take note of EIA’s projections the Annual Energy Outlook 2016 (AEO 2016) published in June 2016, for natural gas supply, demand, and prices. The AEO 2016 Reference case incorporates the Clean Power Plan (CPP) final rule and assumes that all states choose to meet a mass-based standard to cover both existing and new sources of carbon dioxide emissions. Although Reference case natural gas consumption for the year 2040 (the end of the forecast period in these Outlooks) was projected to increase by 7.6 Bcf/d between AEO 2014 and AEO 2016 (from 86.7 Bcf/d to 94.3 Bcf/d), total 2040 lower-48 domestic dry gas production was projected to increase by nearly twice that amount, increasing by 14.9 Bcf/d (from 99.7 Bcf/d to 114.6 Bcf/d). In addition, the projected 2040 Henry Hub price declined from $8.03 per million British thermal units (MMBtu) to $4.86/MMBtu (both prices in constant 2015 dollars), despite projected Reference case 2040 net exports (including both pipeline and LNG exports) rising

164 2015 Study at 8.
165 2014 Study at 25.
from 15.9 Bcf/d in AEO 2014 to 20.7 Bcf/d in AEO 2016. As described here, the AEO 2016 Reference case, even more so than the AEO 2014, projects robust domestic supply conditions that are more than adequate to meet domestic needs and supply exports.

B. Distributional Impacts

1. Gross Domestic Product (GDP)

   a. Comments

Several commenters, including IECA, allege that any macroeconomic benefits from the 2015 LNG Export Study are likely overstated. Cascadia Wildlands, Sierra Club, and Hair on Fire Oregon, among others, allege that, in concluding that LNG exports would create a net benefit to the economy, the 2015 Study relied too heavily on the fact that exports will increase GDP while failing to give adequate weight to projected domestic natural gas price increases, foreign natural gas price decreases, and deleterious socio-economic, sectoral, and regional impacts on consumers, households, and the middle class, including wage-earners. Additionally, Cascadia Wildlands notes that the 2015 Study concludes that economic benefits associated with LNG exports are only “marginally positive,” and asserts that this margin is so small as to be within the margin of error for the Study’s calculations. IECA argues that the 2015 Study fails to account for the lost capital investment opportunity that would have occurred in the absence of LNG exports, as well as for the significant jobs that would have been created in the United States had it not been for higher natural gas prices, thus eliminating any “marginally positive” benefits associated with LNG exports.

Conversely, a number of other commenters, including API, Exxon Mobil Corporation, African American Environmentalist Association, William Shughart, Western Energy Alliance, and the City of Tulsa’s Office of the Mayor, assert that LNG exports will create jobs and boost the economy. For example, the African American Environmentalist Association states that a
report by ICF International shows that LNG exports will result in a net gain in employment in
the United States, and that the job impacts of LNG exports will grow larger as export volumes
rise.

b. DOE/FE Analysis

The 2015 LNG Export Study analyzed the macroeconomic impacts of LNG exports in
five areas. These are U.S. natural gas production and investment, U.S. natural gas prices,
recycling of extra profits from the U.S. natural gas sector, changes to natural gas production and
investment in the rest of the world, and international natural gas prices.\textsuperscript{168} Although some
commenters assert that the 2015 Study failed to give adequate weight to changes in natural gas
prices, Rice-Oxford noted that the first two areas of impact—U.S. natural gas production and
investment and U.S. natural gas prices—are the most significant for the United States and
broadly offset each other.

The Studies found that increasing LNG exports from 12 Bcf/d to 20 Bcf/d could increase
GDP by up to $20 billion. The 2015 Rice-Oxford Study found in its Reference domestic case
(the 20 Bcf/d export case) that, in the long run, U.S. GDP was 0.03 percent higher on average
($7.7 billion annually in today’s prices) over 2026-2040 than in the 12 Bcf/d export case.\textsuperscript{169} The
2015 Study’s result of GDP gains is consistent with the results of the EIA 2014 LNG Export
Study. The 2014 EIA Study found that GDP increases across all cases “range from 0.05% to
0.17% and generally increase with the amount of added LNG exports required to fulfill an export
scenario for the applicable baseline.”\textsuperscript{170} This equals an annual net increase to GDP of $12

\textsuperscript{168} 2015 Study at 14.
\textsuperscript{169} See id.
\textsuperscript{170} 2014 Study at 12.
billion to $20 billion across the scenarios from the 2014 LNG Export Study. These increases are significant, and the Studies project higher levels of employment with increased LNG exports.

2. Sectoral Impacts

a. Comments

Some commenters debate whether LNG exports will impact the domestic energy-intensive, trade-exposed (EITE) sectors disproportionately, at too high a cost to the U.S. economy to justify exporting LNG. Specifically, IECA and Citizens Against LNG assert that increasing LNG exports reduces the cost of natural gas to our global competitors and simultaneously increases the domestic cost of natural gas and electricity—negatively impacting EITE industries. According to these commenters, exporting LNG will drive up the price of natural gas for American consumers and manufacturers, eliminate jobs, and create a financial burden in an already stressed American economy. IECA further contends that the 2015 Study fails to include the “relative cost impact” to EITE industries, *i.e.*, “the combined impact of lower prices to our global competitors and higher prices domestically,” and thus overstates the macroeconomic results associated with LNG exports. Stating that the 2015 Study fails to cite any studies on the price sensitivity of EITE industries, IECA also questions whether any research on EITE industries was conducted as part of the Study.

Other commenters, including API and ExxonMobil, dispute these arguments. They challenge the notion that an LNG export industry cannot co-exist with a growing domestic manufacturing base. API, ExxonMobil, and Golden Pass Products, LLC emphasize the size and productivity of the U.S. natural gas resource base, contending that there is an abundance of natural gas to support both LNG export demand and continued growth in the EITE industries.

---

171 See id. at 32 (“Gross Domestic Product” in 2005 U.S. dollars).
These commenters note that the vast supply of natural gas in the United States will continue to support current gains in domestic manufacturing, even as LNG exports take place. They also state that LNG exports will both sustain and increase domestic production of natural gas, which, in turn, will provide EITE industries with a greater supply of natural gas at more stable prices, allowing them to stay globally competitive.

Other commenters, such as John L. Rafuse, LNG Allies, and American Council for Capital Formation, maintain that there would be serious consequences to hindering the export of LNG. They state that, if exports are prohibited or constrained, the United States will lose economic benefits that other countries will capture as those countries begin extracting their shale gas resources and competing in the global LNG export market. Many commenters, including Institute for 21st Century Energy, Western Energy Alliance, API, and Golden Pass Products, LLC, similarly assert that it would not be in the public interest for DOE to limit LNG exports in contravention of U.S. free trade principles.

b. DOE/FE Analysis

With respect to the argument that natural gas confers greater value on the U.S. economy when used in manufacturing than when produced for export, we begin with the observation that more natural gas is likely to be produced domestically if LNG exports are authorized than if they are prohibited. There is no one-for-one trade-off between natural gas used in manufacturing and gas diverted for export. The competition between the demand for natural gas for domestic consumption and the demand for natural gas for export is captured in the modelling for the 2014 and 2015 Studies. In scenarios with increased levels of U.S. LNG exports, both Studies found that greater economic benefits, in terms of GDP, accrued to the U.S. economy due to those exports.
The 2015 Study used the Oxford Economics Global Industry Model (GIM) to model the impact of increased LNG exports on activity at the sector level. The Global Industry Model covers 100 sectors in 67 countries. In that model, forecasts for individual industries are driven by the macroeconomic forecast—consumption, investment, and exports—combined with detailed modeling of industry interactions, such as supply-chain linkages. The 2015 Study presented sector-level impacts for energy-intensive sectors, including chemicals, basic metals and metal products, and non-metallic minerals (which, in turn, includes cement and glass). The 2015 Study projected that the overall impact across sectors is small compared with the expected growth in sector output through 2040.

The 2015 Study noted that higher natural gas prices have a negative impact for energy-intensive manufacturing sectors, and some sectors (glass, cement, and chemicals) will see small declines in output with increased levels of LNG exports. Rice-Oxford found that these declines are “outweighed by gains in manufacturing industries that benefit from increased investment in the natural gas sector and increased construction activity, such as metals, as well as industry gains attributable to the increase in overall demand (i.e., consumer products, food, etc.).” As a result, “the manufacturing sector in aggregate is little impacted.” The 2014 Study found that natural gas price increases would initially challenge EITE industries, “but adverse impacts [would be] ameliorated as energy prices return to base levels and GDP begins to increase.”

With respect to the argument that some industries derive greater economic value from natural gas than others, we continue to be guided by the long-standing principle established in

174 Id. at 67.
175 Id.
176 2014 Study at 26.
our Policy Guidelines that resource allocation decisions of this nature are better left to the market, rather than to DOE, to resolve.

3. Household and Distributional Impacts

a. Comments

Several commenters, including Sierra Club, IECA, Hair on Fire Oregon, Torrey Byles, Cascadia Wildlands, and Citizens Against LNG, maintain that, for most citizens, the macroeconomic benefits of LNG exports, if any, will be minimal. These commenters contend that the main beneficiaries of LNG exports will be a narrow band of the population, chiefly wealthy individuals in the natural gas industry, foreign investors, and those holding stock or having retirement plans invested in natural gas companies. They assert that, by contrast, a majority of Americans will experience negative economic impacts, such as higher gas and electric bills, without sharing in the benefits of the exports.

b. DOE/FE Analysis

The 2015 LNG Export Study analyzed the macroeconomic impacts of LNG exports in five areas. The 2015 Study projected that, for the economy as a whole, “the positive impacts of higher U.S. gas production, greater investment in the U.S. natural gas sector, and increased profitability of U.S. gas producers typically exceeds the negative impacts of higher domestic natural gas prices associated with increased LNG exports.”

As noted previously, DOE believes that the public interest generally favors authorizing proposals to export natural gas that have been shown to lead to net benefits to the U.S. economy. While there may be circumstances in which the distributional consequences of an authorizing decision could be shown to be so negative as to outweigh net positive benefits to the U.S.

177 2015 Study at 16.
economy as a whole, we do not see sufficiently compelling evidence that those circumstances are present here. None of the commenters advancing this argument has performed a quantitative analysis of the distributional consequences of authorizing LNG exports at the household level. Given the findings in the 2014 and 2015 Studies that exports will benefit the U.S. economy as a whole in terms of increased GDP, and absent stronger record evidence on the distributional consequences of authorizing the proposed exports, we cannot say that those exports are inconsistent with the public interest on these grounds.

4. Regional Impacts

a. Comments

Many commenters, including Oregon Wild and Harriett Heywood, address the issue of negative and positive regional impacts potentially associated with LNG exports. For example, Ninette Jones and Paula Jones assert that shale gas development and production will have a negative impact on local industries that is incompatible with extraction-related activities, such as agriculture and tourism. These commenters, along with Oregon Wild, identify specific ways in which they allege local communities near shale gas production areas, pipelines, and/or LNG export terminals could be adversely affected by increases in natural gas production and LNG exports. They cite property devaluation, degradation of infrastructure, environmental and public health issues, harm to local economies, and safety risks, among other issues.

Other commenters seek to rebut these concerns by identifying the positive regional benefits associated with LNG exports, both in regions where shale development and production occur, and the regions in which LNG export terminals may be located. The African American Environmentalist Association, the Small Business & Entrepreneurship Council, Women Impacting Public Policy, Our Energy Movement, Center for Liquefied Natural Gas, Sempra LNG, and Western Energy Alliance cite regional economic benefits associated with each LNG
project, including the potential for new jobs, substantial direct and indirect business income, and millions of dollars in new tax revenue. Jordan Cove Energy Project, L.P., affirms the positive regional benefits associated with LNG exports, but contends that the 2014 and 2015 LNG Export Studies fail to consider these positive regional impacts to the disadvantage of pending LNG projects subject to review by DOE/FE.

b. DOE/FE Analysis

We agree with the commenters who contend that a general consideration of regional impacts is outside of the scope of the 2014 and 2015 LNG Export Studies, and that regional impacts are appropriately considered by DOE/FE on a case-by-case basis during the review of each LNG export application. We have addressed these issues in the Discussion and Conclusions below. See infra.

C. Estimates of Domestic Natural Gas Supplies

1. Comments

Clarence Adams and other commenters assert that, in addition to underestimating the demand for domestically produced natural gas, the 2015 Study overestimates future domestic supplies of natural gas. Mr. Adams contends that several factors may limit domestic supplies of natural gas, including: (i) new sources of LNG coming online internationally, (ii) increasing resistance to hydraulic fracturing in the United States, and (iii) the shorter-than-expected productivity of shale gas wells. According to these commenters, lower than estimated supplies of natural gas will exacerbate the likely price increases due to exports.

Contrary to these arguments, many commenters, such as API, the City of Tulsa’s Office of the Mayor, Tara Shumata Lee, and Triana Energy, LLC, argue that the United States has abundant domestic natural gas reserves.

Other commenters, such as Oregon Wild, Torrey Byles, and Sierra Club, contend that, to
become energy independent, the United States must preserve its supplies of finite domestic energy resources, not export them. They argue that authorizing LNG exports will hasten the depletion of this country’s natural gas resource base. In their view, investment in LNG exports will take away from potential investment in renewable energy supplies, compounding this country’s dependency on fossil fuels.

2. DOE/FE Analysis

a. Measures of Supply

Before turning to a consideration of the specific comments, it is important to note the various measures of natural gas supply. DOE/FE notes that, by three measures of supply, there are adequate natural gas resources to meet demand associated with the requested authorization. Because these supply estimates have changed over time, however, DOE/FE will continue to monitor them to inform future decisions. These estimates include:

i) AEO natural gas estimates of production, price, and other domestic industry fundamentals. The AEO 2016 Reference case projection of dry natural gas production in 2035 increased significantly (by 37.3 Bcf/d) as compared with AEO 2011, while projections of domestic natural gas consumption in 2035 also increased in AEO 2016 compared with AEO 2011 (by 16.6 Bcf/d). Even with higher production and consumption, the 2035 projected natural gas market price in the Reference case declined from $7.72/MM Btu (2015$) in AEO 2011 to $4.91/MM Btu (2015$) in AEO 2016. The implication of the latest EIA projections in AEO 2016 is that a greater quantity of natural gas is projected to be available at a lower cost than estimated five years ago.

ii) Proved reserves of natural gas. Proved reserves of natural gas have been increasing. Proved reserves are those volumes of oil and natural gas that geologic and engineering data demonstrate with reasonable certainty to be recoverable in future years from
known reservoirs under existing economic and operating conditions. The R/P ratio measures the number of years of production (P) that proved reserves (R) represent at current production rates. Typically industry maintains proved reserves at about 10 years of production, but as Table 5 below demonstrates, reserves have increased from 9.2 years of production in 2000 to 13.9 years of production in 2014, the latest year statistics are available. Of particular note is that, since 2000, proved reserves have increased 108 percent to 368,704 Bcf, while production has increased only 38 percent, demonstrating the growing supply of natural gas available under existing economic and operating conditions.

</tr>
</tbody>
</table>

iii) Technically recoverable resources (TRR). Technically recoverable resources have also increased significantly. Technically recoverable resources are resources in accumulations producible using current recovery technology but without reference to economic profitability. They include both proved reserves and unproved resources.179

179 Unproved resources are generally less well known and therefore less precisely quantifiable than proved reserves, and their eventual recovery is less assured.
DOE/FE notes that EIA’s estimates of lower-48 natural gas TRR have increased from 1,816 Tcf in AEO 2010 to 1,996 Tcf in AEO 2015. EIA notes that these levels represent the starting values for the model, and that assumed future technological improvements in the model add to the TRR while production subtracts from the TRR.

b. Supply Impacts

The 2014 and 2015 Studies each conclude that, for the period of the analysis, the United States is projected to have ample supplies of natural gas resources that can meet domestic needs for natural gas and the LNG export market. Additionally, most projections of domestic natural gas resources extend beyond 20 to 40 years. While not all TRR is currently economical to produce, it is instructive to note that EIA’s recent estimate of TRR equates to nearly 83 years of natural gas supply at the 2015 domestic consumption level of 27.47 Tcf. Moreover, given the supply projections under each of the above measures, we find that granting the requested authorization is unlikely to affect adversely the availability of natural gas supplies to domestic consumers such as would negate the net economic benefits to the United States.

We further find that, given these estimates of supply, the projected price increases and increased price volatility that could develop in response to a grant of the requested LNG export authorization are not likely to negate the net economic benefits of the exports. This issue is discussed below. With regard to the adequacy of supply, however, it bears noting that while certain commenters contend that U.S. natural gas production would not be able to meet unlimited LNG exports and domestic demand, the 2015 Study supports a different conclusion. The 2015 Study supports a different conclusion.

---

Study included scenarios in which LNG exports were unconstrained. Should the U.S. resource base be less robust and more expensive than anticipated, U.S. LNG exports would be less competitive in the world market, thereby resulting in lower export levels from the United States. By way of example, the 2015 Study modeled a number of low resource recovery scenarios, which had U.S. resources that were less robust and more expensive than other cases. In these low resource recovery scenarios, U.S. wellhead natural gas prices were driven up by higher production costs, and prices increased to a level that lowered demand for exports compared to the Reference case. In other unconstrained cases evaluated with the high resource recovery scenarios, domestic natural gas production was able to keep up with the increased demand for U.S. LNG exports compared to the Reference case. In all of these cases, the supply and price response to LNG exports did not negate the net economic benefit to the economy from the exports.

c. Supply Impacts Related to Renewable Energy Sources

To the degree that natural gas prices may increase, alternative sources of energy will become more attractive to consumers and investors. Accordingly, the 2014 Study forecasts increases in electricity from renewable energy resources across the LNG export cases over the 2015-2040 timeframe. Therefore, we do not agree with the suggestion that LNG exports would diminish investment in renewable energy.

Further, the 2014 and 2015 Studies did not evaluate the steps to become energy independent, as that was not part of the criteria evaluated. However, both Studies concluded that the United States has ample supplies of natural gas resources that can both meet domestic needs for natural gas and allow for participation in the LNG export market, without a significant impact on supplies or prices for the period of the analysis under the assumptions made.
D. Modeling the LNG Export Business

1. Comments

Several commenters, including Hair on Fire Oregon, Torrey Byles, Sierra Club, and Citizens Against LNG, contend that the 2015 LNG Export Study incorrectly assumed that the financing of investments in natural gas supplies for export and in the LNG export projects that will be used for export operations would originate from U.S. sources. These commenters assert that, in fact, a substantial portion of the investment is being made by foreign entities, and these foreign entities—not domestic corporations—will reap the benefits of export activity in the form of royalties, tolling fees, income, and tax proceeds from the resale of LNG overseas.

In addition, Clarence Adams contends that the 2015 Study misrepresents the amount of natural gas used by LNG terminals in the liquefaction process, which understates the demand associated with exports. He contends that any volumes used in the liquefaction process (approximately 10 percent of the export volume) should be considered domestic consumption.

2. DOE/FE Analysis

The 2014 and 2015 Studies did not discuss the impact of foreign investment. The 2015 Study concluded that the main path for positive impacts to GDP from increased U.S. LNG exports is through higher production and greater investment in the natural gas sector in the United States. These positive impacts are “due to the fact that most of any U.S. LNG exports would be made possible by increased extraction rather than the diversion of natural gas supplies.”\(^{181}\) The 2015 Study also noted that the model assumes U.S. producers receive the U.S. benchmark Henry Hub price on LNG exports rather than the price in the international destination

---

\(^{181}\) 2015 Study at 83.
market. The 2014 Study stated that “increased energy production spurs investment, which more than offsets the adverse impact of somewhat higher energy prices when export scenarios are applied.”

As for consideration of the natural gas consumed in the liquefaction process, both the 2014 and 2015 Studies assumed a consumption level equal to 10 percent of the natural gas feedstock, which is included in the models.

E. Cost of Environmental Externalities

1. Comments

Sierra Club, along with Citizens Against LNG, Hair on Fire Oregon, Cascadia Wildlands, Oregon Wild, Torrey Byles, MA Rohrer, and Harriet Heywood, maintain that LNG exports will increase demand for natural gas, thereby increasing negative environmental and economic consequences associated with natural gas production. These and other commenters assert that the 2015 Study failed to consider the cost of environmental externalities that would follow such exports. The externalities identified by these commenters include:

- Environmental costs associated with producing more natural gas to support LNG exports, including the costs, risks, and impacts associated with hydraulic fracturing and drilling to produce natural gas; and costs associated with increased water scarcity to support hydraulic fracturing, especially in the drought-stricken regions of the West Coast;

- Environmental costs associated with the life cycle of U.S. LNG (hydraulic fracturing of shale gas, liquefaction, and export) in the form of increased emissions of GHGs and other air pollutants, climate change, and local impacts such as ocean acidification;

- Local and regional costs associated with LNG exports, including impacts on local communities and industries;

---

182 Id. at 64.
183 2014 Study at 12.
• The costs associated with eminent domain, which may be necessary to build new pipelines to transport natural gas;
• The costs of hazards associated with LNG developments, such as costs for police, fire, and security personnel overseeing LNG tanker deliveries; risks associated with LNG-related explosions; and threats related to natural disasters, terrorism, and disruption of LNG facilities, storage tanks, and related systems;
• The potential regulatory costs and impacts of environmental regulations governing hydraulic fracturing and natural gas drilling; and
• The social costs of carbon and methane associated with natural gas emissions.

2. DOE/FE Analysis

All environmental issues are discussed below. See infra §§ VIII, IX, X, XII.

F. Prices and Volatility

1. Natural Gas Price Volatility

a. Comments

Several commenters, such as IECA, Sierra Club, MA Rohrer, and Citizens Against LNG, address potential natural gas price volatility associated with LNG exports. They contend that there is little evidence that domestic natural gas price volatility will be reduced by LNG exports. Rather, they argue that increases in LNG exports will increase demand for natural gas, driving up prices in the United States and adversely affecting electric and natural gas utility consumers, EITE industries, and residential consumers.

Sierra Club, Citizens Against LNG, and Torrey Byles also assert that, as domestic natural gas prices rise due to LNG exports, some electric power companies will want to switch from gas-based to coal-based electric generation. However, because there is less coal-fired capacity to switch to, coal-fired options could be limited, which will drive natural gas prices higher than expected. In this regard, they state that the 2014 EIA Study indicates that increasing exports of
LNG will cause increased domestic coal use in all export scenarios, but fails to address or quantify the environmental impacts of this switch.

b. DOE/FE Analysis

Natural gas price volatility can be measured in terms of short term changes—daily or monthly volatility—or over longer periods. Short term volatility is largely determined by weather patterns, localized service outages, and other factors that appear unlikely to be affected substantially by DOE export authorization decisions. Moreover, the 2014 and 2015 Studies were long-term analyses covering a 25-year period, and thus were not intended to focus on short term shocks or volatility.

To the extent commenters are concerned about the risk of large upward price spikes sustained over longer periods, such as those that occurred in 2005 and 2008, we do not agree that LNG exports will necessarily exacerbate this risk. First, as noted above, when domestic wholesale gas prices rise above the LNG netback price, LNG export demand is likely to diminish, if not disappear altogether. Therefore, under some international market conditions, LNG export facilities are likely to make natural gas demand in the United States more price-elastic and less conducive to sustained upward spikes. Second, in light of our findings regarding domestic natural gas reserves explained above, we see no reason why LNG exports would interfere with the market’s supply response to increased prices. In any capital intensive industry, investments are made based on observed and anticipated market signals. In natural gas markets, if prices or expected prices rise above the level required to provide an attractive return on investment for new reserves and production, industry will make that investment to capture the anticipated profit. These investments spur development of reserves and production and increase availability of natural gas, exerting downward pressure on prices. This is part of the normal business cycle that was captured in the 2014 and 2015 Studies. On balance, we are not
persuaded that LNG exports are likely to increase substantially the volatility of domestic natural gas prices.

2. Linking the Domestic Price of Natural Gas to World Prices

a. Comments

Commenters, including IECA and Citizens Against LNG, argue that LNG exports could link domestic natural gas prices to the price of natural gas in the world market, and that this could exacerbate the potential increase in domestic natural gas prices as well as increase price volatility.

By contrast, API argues that natural gas prices will not rise to global prices because the market will limit the amount of U.S. natural gas that will be exported, since liquefaction, transportation, and regasification costs act as a cushion. API argues that, if this cushion disappears and the U.S. export price rises to the global LNG price, market forces will bring U.S. exports to a halt.

b. DOE/FE Analysis

The 2015 Study examined changes in three benchmark prices across the export scenarios: the Henry Hub price in the United States, the National Balancing Point (NBP) price in the United Kingdom, and the Japan Korea Marker (JKM) price. In general, the Henry Hub price rises as LNG exports increase, while the other benchmark prices decline. The 2015 Study stated that this is the result of allowing increased trade from the United States, thereby serving to relax the highly constrained supply situation internationally in the scenarios.\(^{184}\) The 2015 Study presented the price spreads among JKM and Henry Hub and NBP and Henry Hub for all of the cases considered from 2015-2040. The JKM-Henry Hub price spread in 2040 ranges from $5 to over

\(^{184}\) 2015 Study at 58.
$15 across the scenarios; the spread for NBP-Henry Hub in 2040 is roughly $3 to nearly $8.185

The 2015 Study noted that the impact of LNG exports on the Henry Hub price depends on both domestic and international market considerations. For example, Henry Hub prices would rise with increased domestic demand for natural gas.

Additionally, prices for U.S. LNG would include the cost of inland transportation, liquefaction, shipping, and regasification. The 2015 Study’s model assumed competition among different suppliers, such that buyers would have no incentive to buy natural gas from the United States if the delivered price after liquefaction and transportation is higher than the alternative delivered LNG price from other sources. DOE/FE agrees that a competitive market would behave in this manner and U.S. natural gas prices would be lower than international LNG prices in such a market by at least the costs previously described. Further, the introduction of LNG exported from the United States into the international market would tend to exert downward pressure on the prevailing higher delivered price for LNG in those foreign markets and could weaken the “oil-indexed” pricing terms.

For these reasons, we agree with those commenters who maintain that LNG exports from the United States will have difficulty competing with LNG exports from other countries unless domestic U.S. natural gas can be produced much cheaper. There is no evidence before us demonstrating that the prices of natural gas or LNG in the international market are more volatile than the prices in the U.S. domestic market.

IX. DOE/FE ADDENDUM TO ENVIRONMENTAL REVIEW DOCUMENTS CONCERNING EXPORTS OF NATURAL GAS FROM THE UNITED STATES

On June 4, 2014, DOE/FE published the Draft Addendum for public comment. The purpose of the Addendum, DOE/FE explained, was to provide information to the public regarding

185 Id. at 52.
the potential environmental impacts of unconventional natural gas production. Although not
required by NEPA, DOE/FE prepared the Addendum in an effort to be responsive to the public
and to provide the best information available on a subject that had been raised by commenters in
this and other LNG export proceedings. The 45-day comment period on the Draft Addendum
closed on July 21, 2014. DOE/FE received 40,745 comments in 18 separate submissions, and
considered those comments in issuing the Addendum on August 15, 2014.186 DOE provided a
summary of the comments received and responses to substantive comments in Appendix B of the
Addendum.187 DOE/FE has incorporated the Draft Addendum, comments, and final Addendum
into the record in this proceeding.

The Addendum focuses on the environmental impacts of unconventional natural gas
production, which primarily includes production from shale formations, but also includes tight gas
and coalbed methane production. DOE/FE elected to focus the Addendum on unconventional
production because such production is considered more likely than other forms of production to
increase in response to LNG export demand. EIA’s 2012 Study, published as part of the LNG
Export Study, projected that more than 90 percent of the incremental natural gas produced to
supply LNG exports would come from these unconventional sources.188

Although the 2012 EIA Study made broad projections about the types of resources from
which additional production may come, the Addendum stated that DOE cannot meaningfully
estimate where, when, or by what particular method additional natural gas would be produced in
response to non-FTA export demand. Therefore, the Addendum focuses broadly on

unconventional production in the United States as a whole, making observations about regional differences where appropriate.

The Addendum discusses several categories of environmental considerations—Water Resources, Air Quality, Greenhouse Gas, Induced Seismicity, and Land Use Impacts—each of which is summarized briefly below.

A. Water Resources

1. Water Quantity

Natural gas production from shale resources requires water at various stages of development, approximately 89 percent of which is consumed through the process of hydraulic fracturing. The Addendum presents information regarding water usage for shale gas production both in comparison to other energy sources and other regional uses. Although production of natural gas from shale resources is more water-intensive than conventional natural gas production, it is substantially less water-intensive than many other energy sources over the long term after the well has been put into production. As shown in the Addendum, Table 6 below captures differences in water intensity across energy sources.

The Addendum also explains that, despite its relatively low long-term water intensity, shale gas production could impact water supply in specific areas, particularly arid regions such as the Eagle Ford Shale play in Texas. The Addendum notes that the relationship between shale gas production and water quantity is principally a local issue, and that the degree of impact depends on “the local climate, recent weather patterns, existing water use rates, seasonal fluctuations, and other factors.”\(^{191}\) The following Table 7 shows the variation in the proportion of water usage by activity in shale gas regions:

2. Water Quality

Observing that water quality concerns may have received more attention than any other aspect of unconventional natural gas production, the Addendum addresses water quality issues arising from four aspects of unconventional natural gas production: construction, drilling, use of hydraulic fracturing fluids, and handling of flowback and produced waters.

Runoff from the construction of access roads and other earth-disturbing activities can lead to temporary increases in turbidity and sedimentation in surface waters when well sites are being developed. However, the Addendum states that “when standard industry practices and preventative measures are deployed, only minor impacts are likely to result.”\textsuperscript{193}

Drilling in unconventional natural gas production requires penetrating shallower fresh water aquifers. Referring to NETL’s Modern Shale Gas Development in the United States: A Primer, the Addendum briefly explains the manner in which such drilling can be undertaken to protect fresh water aquifers.\textsuperscript{194} The Addendum acknowledges, however, that while unconventional natural gas formations are thousands of feet below aquifers associated with public

\textsuperscript{192 Id. at 12 (Table 3) (citations omitted).}
\textsuperscript{193 Id. at 13.}
water supply or surface hydrological connection, poor construction practices may cause failure of a casing or cement bond. This failure, in turn, could lead to potential contamination of an aquifer. The Addendum also observes that drilling may create connections with existing fractures or faults, or improperly plugged or abandoned wells, allowing contaminants to migrate through the subsurface.  

The fluid used for hydraulic fracturing consists of over 98 percent water, but also may include several different chemical compounds. These compounds can vary from well to well based on site specific geological information. The Addendum describes federal and state efforts to gather information and require disclosure of the types of chemical additives being used in hydraulic fracturing. The risks posed by the use of these fluids may come from spills and leakages during transport to the well, storage on the well pad, or during the chemical mixing process. Further, chemical additives may contaminate groundwater should the integrity of the casing or cement seal of the well be compromised.  

The Addendum considers the potential environmental impacts associated with produced water recovered during flowback operations. Produced water may contain elevated levels of total dissolved solids, salts, metals, organics, and natural occurring radioactive materials, as well as the chemicals included in the fracturing fluid noted above. The Addendum discusses the three principal ways of mitigating the impacts associated with produced water: minimization of the quantity of water used, recycling and re-use of produced water, and disposal.  

Concluding its discussion of water resources, the Addendum observes that “[u]nconventional natural gas production, when conforming to regulatory requirements,
implementing best management practices, and administering pollution prevention concepts, may have temporary, minor impacts to water resources.”

Further, risks may arise when best practices are not employed: “[I]mproper techniques, irresponsible management, inadequately trained staff, or site-specific events outside of an operator’s control could lead to significant impacts on local water resources.”

B. Air Quality

The Addendum discusses air pollutants emitted at different stages of the natural gas production process. These emissions and their sources are captured in Table 8 below:

**Table 8: Source Categories of Airborne Emissions from Upstream Natural Gas Activities (EPA, 2013)**

<table>
<thead>
<tr>
<th>Type of Emissions</th>
<th>Sources of Emissions</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Combustion Emissions</strong></td>
<td>NOx and carbon monoxide (CO) resulting from the burning of hydrocarbon (fossil) fuels. Air toxics, PM, un-combusted VOCs, and CH4 are also emitted. Engines, heaters, flares, incinerators, and turbines.</td>
</tr>
<tr>
<td><strong>Vented Emissions</strong></td>
<td>VOCs, air toxics, and CH4 resulting from direct releases to the atmosphere.</td>
</tr>
<tr>
<td><strong>Fugitive Emissions</strong></td>
<td>VOCs, air toxics, and CH4 resulting from uncontrolled and under-controlled emissions.</td>
</tr>
</tbody>
</table>
The Addendum describes the existing regulatory framework relating to such emissions, as well as the U.S. Environmental Protection Agency’s (EPA) 2012 New Sources Performances Standards for hydraulically fractured natural gas wells\textsuperscript{202} and EPA’s 2013 update to those standards covering storage tanks.\textsuperscript{203} The Addendum also summarizes the existing literature on each significant category of air pollutant and describes the potential contribution of oil and gas production activities to ground-level ozone pollution and reduced visibility in sensitive areas.

The Addendum concludes its discussion of air quality by stating that natural gas development leads to both short- and long-term increases in local and regional air emissions, especially methane, VOCs, and hazardous air pollutants. According to the Addendum, the intermittent nature of air emissions from sources such as wells makes it difficult to analyze impacts at the regional level. As more data become available, a better understanding of trends in local and regional air quality and potential impacts may emerge.\textsuperscript{204}

**C. GHG Emissions**

Separate from the LCA GHG Report described below, the Addendum includes a discussion of GHG emissions associated with unconventional natural gas production— principally methane and carbon dioxide. The Addendum describes the nature of GHG emissions from each phase of the production process, including: well drilling and completion; gas production; well re-completions, workovers, and maintenance; gas processing; and gas transmission and storage.

The Addendum also summarizes regulations affecting GHG emissions from upstream natural gas activity. As in the air quality section, the Addendum discusses EPA’s 2012 New

\textsuperscript{202} *Id.* at 20-22.
\textsuperscript{203} *Id.* at 22.
\textsuperscript{204} *Id.* at 32.
Source Performance Standards regulations. The Addendum also describes EPA’s publication in April 2014 of five technical white papers on potentially significant sources of emissions in the oil and gas sector, including completions and ongoing production of hydraulically fractured oil wells, compressors, pneumatic valves, liquids unloading, and leaks.\textsuperscript{205} EPA stated that it will use these white papers, along with input from peer reviewers and the public to determine how best to pursue emissions reductions from these sources, possibly including the development of additional regulations.\textsuperscript{206}

Finally, the Addendum summarizes the existing literature estimating GHG emissions and methane leakage rates from the upstream natural gas industry, noting that most studies suggest that “emissions of GHGs from the upstream industry are of similar magnitude for both conventional and unconventional sources.”\textsuperscript{207}

**D. Induced Seismicity**

The Addendum provides information on induced seismicity across various types of energy resource activities, namely the production of natural gas, gas condensates, and oil from currently targeted unconventional plays. More specifically, it provides greater detail about the potential for induced seismicity from hydraulic fracturing and wastewater disposal via injection, which is one method of disposing of produced water. Because the duration of injection of hydraulic fracturing fluids is generally minutes or hours and the quantity of injected fluid is relatively low, the Addendum states that “the probability of injecting enough fluid into a natural fault to trigger a felt earthquake is low.”\textsuperscript{208} By contrast, the Addendum states that the “incidence of felt earthquakes is

\textsuperscript{206} Id. at 44.

\textsuperscript{207} Id. at 40.

\textsuperscript{208} Id. at 51.
higher for wastewater disposal via wastewater injection wells because a large volume of water is injected over a longer period of time without any withdrawal of fluids, with the result that fluid pressures can be increased within a large area surrounding the injection well.”209 The Addendum identifies seismic events thought to have been triggered by wastewater disposal into injection wells in Oklahoma, Colorado, Arkansas, and Ohio.

Addressing the severity of seismic events induced by natural gas activities, the Addendum cites a 2013 National Research Council report characterizing the risk of induced seismicity as principally one of alarm to the public and minor property damage, as opposed to significant disruption.210

E. Land Use

The Addendum addresses potential land use impacts resulting from unconventional natural gas production. Land use impacts arise from the construction and development of new access roads, heavy truck traffic on existing local roadways, well pads, pipeline rights of way, and other structures such as compressor stations. The Addendum includes discussions of increased vehicle traffic, habitat fragmentation, reflective light pollution, noise, and other impacts associated with these land use changes. According to the Addendum, “[t]he real issue with land use impacts is not the minor impacts related to each well pad, access road, or pipeline.”211 Rather, “[w]hen the impacts from these individual components of shale gas development are considered in aggregate, or cumulatively, the impacts become magnified on an ecosystem or regional scale.”212 The Addendum identifies siting and design considerations that may minimize land use impacts, as well

209 Id. at 52.
211 Addendum at 62.
212 Id.
as traffic and road way impacts associated with large vehicles and concerns for vehicular safety for the motoring public.

X. DOE/FE LIFE CYCLE GREENHOUSE GAS PERSPECTIVE ON EXPORTING LIQUEFIED NATURAL GAS FROM THE UNITED STATES

A. Description of LCA GHG Report

In January 2014, DOE/FE commissioned NETL to undertake a study analyzing the life cycle emissions of greenhouse gases (GHG), including carbon dioxide (CO₂) and methane (CH₄), associated with natural gas produced in the United States and exported as LNG to other countries for use in electric power generation. The study was intended to inform DOE/FE’s decision-making under NGA section 3(a) and to provide additional information to the public. The study—entitled Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas from the United States (LCA GHG Report)—estimated the life cycle GHG emissions of domestically produced LNG (also referred to as U.S. LNG) exports to Europe and Asia, compared with alternative fuel supplies (such as regional coal and other imported natural gas), for electric power generation in the destination countries.

NETL published the LCA GHG Report on May 29, 2014, as well as a 200-page supporting document entitled, Life Cycle Analysis of Natural Gas Extraction and Power Generation.213 On June 4, 2014, DOE/FE provided notice of the documents in the Federal Register and invited public comment.214 The 45-day public comment period closed July 21, 2014. In this section, we

summarize the scope of the LCA GHG Report, as well as its methods, limitations, and conclusions. Below, we summarize the public comments on the Report and respond to those comments. See infra § X.B.

1. Purpose of the LCA GHG Report

The LCA GHG Report was designed to answer two principal questions:

- How does LNG exported from the United States compare with regional coal (or other LNG sources) used for electric power generation in Europe and Asia, from a life cycle GHG perspective?

- How do those results compare with natural gas sourced from Russia and delivered to the same European and Asian markets via pipeline?

In establishing this framework, NETL considered the following:

- In what countries will the natural gas produced in the United States and exported as LNG be used?

- How will the U.S. LNG be used in those countries, i.e., for what purpose?

- What are the alternatives to using U.S. LNG for electric power generation in those countries?

Because the exact destination country (or countries) of U.S. LNG cannot be predicted for this study, NETL considered one medium-distance destination (a location in Europe) and one long-distance destination (a location in Asia). NETL chose Rotterdam, Netherlands, as the European destination and power plant location, and Shanghai, China, as the Asian location. NETL used other locations for the alternative sources of natural gas and coal, as specified in the Report. NETL also determined that one of the most likely uses of U.S. LNG is to generate electric power in the destination countries. In considering sources of fuel other than U.S. LNG, NETL assumed that producers in Europe and Asia could generate electricity in the following ways: (1) by

documents and all comments received were placed in the administrative record for each of the 25 non-FTA export application dockets then before DOE/FE, including this docket. See id.
obtaining natural gas from a local or regional pipeline, (2) by obtaining LNG from a LNG producer located closer geographically than the United States, or (3) by using regional coal supplies, foregoing natural gas altogether.

Using this framework, NETL developed four study scenarios, identified below. To compare scenarios, NETL used a common denominator as the end result for each scenario: one megawatt-hour (MWh) of electricity delivered to the consumer, representing the final consumption of electricity. Additionally, NETL considered GHG emissions from all processes in the LNG supply chains—from the “cradle” when natural gas or coal is extracted from the ground, to the “grave” when electricity is used by the consumer. This method of accounting for cradle-to-grave emissions over a single common denominator is known as a life cycle analysis, or LCA.215

Using this LCA approach, NETL’s objective was to model realistic LNG export scenarios, encompassing locations at both a medium and long distance from the United States, while also considering local fuel alternatives. The purpose of the medium and long distance scenarios was to establish likely results for both extremes (i.e., both low and high bounds).

2. Study Scenarios

NETL identified four modeling scenarios to capture the cradle-to-grave process for both the European and Asian cases. The scenarios vary based on where the fuel (natural gas or coal) comes from and how it is transported to the power plant. For this reason, the beginning “cradle” of each scenario varies, whereas the end, or “grave,” of each scenario is the same because the uniform goal is to produce 1 MWh of electricity. The first three scenarios explore different ways

215 The data used in the LCA GHG Report were originally developed to represent U.S. energy systems. To apply the data to this study, NETL adapted its natural gas and coal LCA models. The five life cycle stages used by NETL, ranging from Raw Material Acquisition to End Use, are identified in the LCA GHG Report at 1-2.
to transport natural gas; the fourth provides an example of how regional coal may be used to
generate electricity, as summarized in Table 9 below:

Table 9: LCA GHG Scenarios Analyzed by NETL²¹⁶

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Description</th>
<th>Key Assumptions</th>
</tr>
</thead>
</table>
| 1        | • Natural gas is extracted in the United States from the Marcellus Shale.  
          • It is transported by pipeline to an LNG facility, where it is cooled to liquid form, loaded onto an LNG tanker, and transported to an LNG port in the receiving country (Rotterdam, Netherlands, for the European case and Shanghai, China, for the Asian case).  
          • Upon reaching its destination, the LNG is re-gasified, then transported to a natural gas power plant. | The power plant is located near the LNG import site. |
| 2        | • Same as Scenario 1, except that the natural gas comes from a regional source closer to the destination.  
          • In the European case, the regional source is Oran, Algeria, with a destination of Rotterdam.  
          • In the Asian case, the regional source is Darwin, Australia, with a destination of Osaka, Japan. | Unlike Scenario 1, the regional gas is produced using conventional extraction methods, such as vertical wells that do not use hydraulic fracturing. The LNG tanker transport distance is adjusted accordingly. |
| 3        | • Natural gas is produced in the Yamal region of Siberia, Russia, using conventional extraction methods.²¹⁷  
          • It is transported by pipeline directly to a natural gas power plant in either Europe or Asia. | The pipeline distance was calculated based on a “great circle distance” (the shortest possible distance between two points on a sphere) between the Yamal district in Siberia and a power plant located in either Rotterdam or Shanghai. |
| 4        | • Coal is extracted in either Europe or Asia. It is transported by rail to a domestic coal- | This scenario models two types of coal widely used to generate |

²¹⁶ The four scenarios are set forth in the LCA GHG Report at 2.
²¹⁷ Yamal, Siberia, was chosen as the extraction site because that region accounted for 82.6% of natural gas production in Russia in 2012.
In all four scenarios, the 1 MWh of electricity delivered to the end consumer is assumed to be distributed using existing transmission infrastructure.

3. **GHGs Reported as Carbon Dioxide Equivalents**

Recognizing that there are several types of GHGs, each having a different potential impact on the climate, NETL normalized GHGs for the study. NETL chose carbon dioxide equivalents (CO$_2$e), which convert GHG gases to the same basis: an equivalent mass of CO$_2$. CO$_2$e is a metric commonly used to estimate the amount of global warming that GHGs may cause, relative to the same mass of CO$_2$ released to the atmosphere. NETL chose CO$_2$e using the global warming potential (GWP) of each gas from the 2013 Intergovernmental Panel on Climate Change (IPCC) Fifth Assessment Report (AR5) (IPCC, 2013). The LCA GHG Report applied the respective GWPs to a 100-year and a 20-year time frame.

4. **Natural Gas Modeling Approach**

NETL states that its natural gas model is flexible, allowing for the modeling of different methods of producing natural gas. For Scenario 1, all natural gas was modeled as unconventional gas from the Marcellus Shale, since that shale play reasonably represents new marginal gas production in the United States. For Scenarios 2 and 3, the extraction process was modeled after conventional onshore natural gas production in the United States. This includes both the regional LNG supply options that were chosen for this study (Algeria for Europe and
Australia for Asia) and extraction in Yamal, Siberia, for pipeline transport to the power plants in Europe and Asia.

In the above three natural gas scenarios, the natural gas is transported through a pipeline, either to an area that processes LNG (Scenarios 1 and 2) or directly to a power plant (Scenario 3). NETL’s model also includes an option for all LNG steps—from extraction to consumption—known as an LNG supply chain. After extraction and processing, natural gas is transported through a pipeline to a liquefaction facility. The LNG is loaded onto an ocean tanker, transported to an LNG terminal, re-gasified, and fed to a pipeline that transports it to a power plant. NETL assumed that the natural gas power plant in each of the import destinations already exists and is located close to the LNG port.

The amount of natural gas ultimately used to make electricity is affected by power plant efficiency. Therefore, the efficiency of the destination power plant is an important parameter required for determining the life cycle emissions for natural gas power. The less efficient a power plant, the more gas it consumes and the more GHG emissions it produces per unit of electricity generated. For this study, NETL used a range of efficiencies that is consistent with NETL’s modeling of natural gas power in the United States.\(^{218}\) NETL also assumed that the efficiencies used at the destination power plants (in Rotterdam and Shanghai) were the same as those used in the U.S. model.

5. Coal Modeling Approach

NETL modeled Scenario 4, the regional coal scenario, based on two types of coal: bituminous and sub-bituminous. Bituminous coal is a soft coal known for its bright bands. Sub-bituminous coal is a form of bituminous coal with a lower heating value. Both types are widely

\(^{218}\) See LCA GHG Report at 4 (citing NETL, Life Cycle Analysis of Natural Gas Extraction and Power Generation).
used as fuel to generate steam-electric power. NETL used its existing LCA model for the extraction and transport of sub-bituminous and bituminous coal in the United States as a proxy for foreign extraction in Germany and China. Likewise, NETL modeled foreign coal production as having emissions characteristics equivalent to average U.S. coal production. No ocean transport of coal was included to represent the most conservative coal profile (whether regionally sourced or imported).

The heating value of coal is the amount of energy released when coal is combusted, whereas the heat rate is the rate at which coal is converted to electricity by a power plant. Both factors were used in the model to determine the feed rate of coal to the destination power plant (or the speed at which the coal would be used). For consistency, this study used the range of efficiencies that NETL modeled for coal power in the United States. The study also assumed the same range of power plant efficiencies for Europe and Asia as the U.S. model.

6. Key Modeling Parameters

NETL modeled variability among each scenario by adjusting numerous parameters, giving rise to hundreds of variables. Key modeling parameters described in the LCA GHG Report include: (1) the method of extraction for natural gas in the United States, (2) methane leakage for natural gas production,219 (3) coal type (sub-bituminous or bituminous),220 (4) the flaring rate for natural gas,221 (5) transport distance (ocean tanker for LNG transport, and rail for

219 The key modeling parameters for the natural gas scenarios are provided in Table 5-1 (LNG) and Table 5-2 (Russian natural gas). See LCA GHG Report at 6. The key parameters for natural gas extraction, natural gas processing, and natural gas transmission by pipeline are set forth in Tables 5-4, 5-5, and 5-6, respectively. See id. at 7-8.
220 The modeling parameters and values for the coal scenarios are provided in Table 5-3. See LCA GHG Report at 6.
221 Flaring rate is a modeling parameter because the global warming potential of vented natural gas, composed mostly of methane, can be reduced if it is flared, or burned, to create CO₂. See id. at 7.
coal transport), and (6) the efficiency of the destination power plant.

For example, as shown in Table 5-1 of the LCA GHG Report, NETL used two different ranges for methane leakage rates for Scenarios 1 and 2: from 1.2 to 1.6% for natural gas extracted from the Marcellus Shale, and from 1.1 to 1.6% from gas extracted using conventional extraction methods. For Scenario 3 (the Russian cases), however, NETL used a higher range for methane leakage rates for both the European and Asian locations, in light of the greater pipeline distance from Russia. As the pipeline distance increases, the total methane leakage from pipeline transmission also increases, as does the amount of natural gas that is extracted to meet the same demand for delivered natural gas. Notably, as part of the study, NETL conducted a methane leakage breakeven analysis to determine the “breakeven leakage” at which the life cycle GHG emissions for natural gas generated power would equal those for the coal Reference case (Scenario 3).

In sum, NETL noted that the LCA study results are sensitive to these key modeling parameters, particularly changes to natural gas and coal extraction characteristics, transport distances, and power plant performance. NETL also identified several study limitations based on the modeling parameters, including: (1) NETL’s LCA models are U.S.-based models adapted for foreign natural gas and coal production and power generation, and (2) the specific LNG export and import locations used in the study represent an estimate for an entire region (e.g., New Orleans representing the U.S. Gulf Coast).

---

222 The distances used for pipeline transport of Russian gas are provided in Table 5-2. See id. at 6.
223 See LCA GHG Report at 5.
224 The methane leakage breakeven analysis is described in the LCA GHG Report at 14 and 15.
225 See LCA GHG Report at 5. To ensure that the study results were robust, NETL conducted several side analyses and sensitivity calculations, as discussed in the LCA GHG Report.
226 The study limitations are described in the LCA GHG Report at 18.
7. Results of the LCA GHG Report

NETL states that two primary conclusions may be drawn from the LCA GHG Report. First, use of U.S. LNG exports to produce electricity in European and Asian markets will not increase GHG emissions on a life cycle perspective, when compared to regional coal extraction and consumption for power production. As shown below in Figures 1 and 2, NETL’s analysis indicates that, for most scenarios in both the European and Asian regions, the generation of power from imported natural gas has lower life cycle GHG emissions than power generation from regional coal. (The use of imported coal in these countries will only increase coal’s GHG profile.) Given the uncertainty in the underlying model data, however, NETL states that it is not clear if there are significant differences between the corresponding European and Asian cases other than the LNG transport distance from the United States and the pipeline distance from Russia.

---

227 NETL’s detailed study results, with corresponding figures, are set forth on pages 8 through 18 of the LCA GHG Report.
228 Although these figures present an expected value for each of the four scenarios, NETL states that the figures should not be interpreted as the most likely values due to scenario variability and data uncertainty. Rather, the values allow an evaluation of trends only—specifically, how each of the major processes (e.g., extraction, transport, combustion) contribute to the total life cycle GHG emissions. See LCA GHG Report at 8-9.
Figure 1: Life Cycle GHG Emissions for Natural Gas and Coal Power in Europe\textsuperscript{229}

\textsuperscript{229} LCA GHG Report at 9 (Figure 6-1).
Second, there is an overlap between the ranges in the life cycle GHG emissions of U.S. LNG, regional alternative sources of LNG, and natural gas from Russia delivered to the European or Asian markets. Any differences are considered indeterminate due to the underlying uncertainty in the modeling data. Therefore, the life cycle GHG emissions among these sources of natural gas are considered similar, and no significant increase or decrease in net climate impact is anticipated from any of these three scenarios.

\[230\] LCA GHG Report at 10 (Figure 6-2).
B. Comments on the LCA GHG Report and DOE/FE Analysis

As discussed above, the LCA GHG Report compares life cycle GHG emissions from U.S. LNG exports to regional coal and other imported natural gas for electric power generation in Europe and Asia. Following the close of the public comment period on the LCA GHG Report, DOE/FE identified 18 unique submissions received from the general public, interest groups, industry, and academia/research institutions, which DOE/FE categorized into seven distinct comments.231

DOE/FE identifies below: (i) the pertinent arguments by topic, with reference to representative comments, and (ii) DOE/FE’s basis for the conclusions that it drew in reviewing those comments. In so doing, DOE/FE will respond to the relevant, significant issues raised by the commenters.

1. Study Conclusions
   a. Comments

   Several commenters, including Citizens Against LNG and Oregon Wild, claim that the life cycle GHG emissions from natural gas are higher than those from coal.

   b. DOE/FE Analysis

   These comments assert that natural gas has higher GHGs than coal, but they do not cite data sources applicable to the comparison of U.S.-exported LNG to regional coal, nor do they acknowledge that the different end uses of coal and natural gas (i.e., heating, power, or transportation) affect their relative life cycle GHG performance. If the characteristics of each fuel (most critically, the carbon content per unit of the fuel’s energy) and power plant

231 In some instances, single letters were sent on behalf of a group of people. In one case, multiple copies of a form letter were received from 149 individuals, hereinafter referred to as “Concerned Citizens.” Most of the individuals in the Concerned Citizens group live in New York, but other states and countries are also represented.
efficiencies are considered, the lower per-MWh CO₂ emissions from natural gas power plants in comparison to coal power plants make natural gas lower than coal in the context of power plant operations by 61% (see Table 10 below, \([ (415 - 1,063)/1,063 \times 100] \)). The life cycle of baseload electricity generation is a reasonable basis for comparing natural gas and coal because both types of fuels are currently used on a large scale by baseload power plants.

Table 10 shows the life cycle GHG emissions CO₂, methane (CH₄), nitrous oxide (N₂O), and sulfur hexafluoride (SF₆) from natural gas and coal systems and demonstrates the importance of power plant operations to total life cycle GHG emissions over 100- and 20-year GWP timeframes. This table is representative of European end-use scenarios, which consume natural gas exported from the United States and coal extracted in Europe. (This table is based on the same data as used by Figure 6-1 of the LCA GHG Report.)

Table 10: Life Cycle GHG Emissions from Natural Gas and Coal Systems (kg CO₂e/MWh)
2. Boundaries of the LCA GHG Report

a. Comments

Sierra Club, Food & Water Watch, Americans Against Fracking et al., Susan Sakmar, and Concerned Citizens, among others, contend that the LCA GHG Report has flawed boundaries and scenarios. In particular, these commenters contend that the LCA GHG Report assumes that LNG will displace coal power without also accounting for the displacement of renewable energy.

b. DOE/FE Analysis

The boundaries of the LCA were developed with respect to questions about two fossil fuels, coal and natural gas, and where they come from. The scenarios in the LCA do not model displacement of any kind. These two scenarios are purely attributional, meaning that they focus on independent supply chains for each scenario and do not account for supply or demand shifts caused by the use of one fuel instead of another fuel.

3. Natural Gas Transport between Regasification and Power Plants

a. Comments

Sierra Club and Concerned Citizens, among others, assert that the LCA GHG Report does not account for natural gas transport between LNG regasification facilities and power plants in the importing countries.

b. DOE/FE Analysis

The choice to exclude transportation between regasification and the power plant was a modeling simplification. The sensitivity analysis of GHG emissions with changes to pipeline

---

232 Sierra Club submitted comments on behalf of its members and supporters as well as Cascadia Wildlands, Otsego 2000, Inc., Columbia Riverkeeper, Stewards of the Lower Susquehanna, Inc., Friends of the Earth, Chesapeake Climate Action Network, Food and Water Watch, and EarthJustice.

233 Food & Water Watch submitted comments in the form of a letter signed by 85 individuals representing various national, state, and local public interest groups.
transport distance, as illustrated by Figures 4-7 and 4-8 of NETL’s *Life Cycle Analysis of Natural Gas Extraction and Power Generation*, shows that the *doubling* (i.e., a 100% increase) of natural gas pipeline transport distance increases the *upstream* GHG emissions from natural gas by 30%. When this upstream sensitivity is applied to the life cycle boundary of the LCA GHG Report, an additional 100 miles beyond the LNG import terminal increases the life cycle GHG emissions for the LNG export scenarios by 0.8%, and an additional 500 miles beyond the LNG import terminal increases the life cycle GHG emissions for the LNG export scenarios by 4% (using 100-year GWPs as specified by the IPCC Fifth Assessment Report). Although this parameter modification changes the results of the LCA slightly, it does not change the conclusions of the LCA GHG Report.

4. **Data Quality for LNG Infrastructure, Natural Gas Extraction, and Coal Mining**

a. **Comments**

Several commenters, including API, Concerned Citizens, and Sierra Club, commented on whether the data used in the LCA GHG Report is current and fully representative of the natural gas industry. In particular, API asserts that NETL’s model is representative of inefficient liquefaction technologies that overstate the GHG emissions from the LNG supply chain, coal data that understates the methane emissions from coal mines, and natural gas extraction data that mischaracterizes “liquids unloading” practices.\(^{234}\) API proposes the use of newer data for both...
liquefaction terminals in the United States and methane emission factors from unconventional natural gas extraction and coal mining. Concerned Citizens argue that the LCA GHG Report does not clearly identify its source of data for estimates of loss related to LNG production, shipping, and regasification, as well as the basis for estimates of pipeline losses from Russia. Sierra Club points to inaccurate referencing of EPA’s Subpart W report, which was the basis for many of NETL’s emission factors for natural gas extraction.

b. DOE/FE Analysis

(1) Liquefaction Data

API points to newer data for liquefaction facilities that have higher efficiencies than the liquefaction process in the LCA GHG Report. API points to the GHG intensities of the liquefaction facilities proposed by Sabine Pass, Cameron LNG, and FLEX, each of which has been granted one or more non-FTA LNG export orders by DOE/FE (see infra § XII.D).

According to API, these proposed facilities will produce 0.26, 0.29, and 0.12 tonnes of CO₂e per tonne of LNG, respectively. The majority of a liquefaction facility’s energy is generated by combusting incoming natural gas, so the GHG intensity of a liquefaction facility is directly related to its efficiency. As API correctly points out, the LCA model assumes a GHG intensity of 0.44 tonnes of CO₂e per tonne of LNG; this GHG intensity is representative of a facility that consumes 12% of incoming natural gas as plant fuel.235

The above GHG intensities and liquefaction efficiencies are not life cycle numbers, but represent only the gate-to-gate operations of liquefaction facilities, beginning with the receipt of

---

processed natural gas from a transmission pipeline and ending with liquefied natural gas ready for ocean transport. As illustrated by Figures 6-1 and 6-2 in the LCA GHG Report (reproduced as tables herein), liquefaction accounts for approximately 10% of the life cycle GHG emissions of U.S. LNG used for electric power generation in Europe and Asia. A doubling of liquefaction efficiency (thus achieving a GHG intensity comparable to the average of the Sabine Pass, Cameron, and Freeport facilities) would lead to a 6% reduction in the feed rate of natural gas to the liquefaction plant. This feed rate reduction would also reduce natural gas extraction, processing, and transmission emissions by 6%, but would not affect the processes downstream from liquefaction (ocean tankers, power plants, and electricity transmission networks). Applying the increased liquefaction efficiency and the 6% reduction in feed rate to the results of the LCA GHG Report would reduce the life cycle GHG emissions for LNG export scenarios by only 1.5% (using 100-year GWPs as stated in the IPCC Fifth Assessment Report). Increasing liquefaction efficiency may significantly reduce the emissions from one point in the supply chain, but it does not change the conclusions of the LCA.

(2) Natural Gas Methane Data

API and Concerned Citizens criticize the quality of data that DOE/NETL uses for natural gas extraction. API’s concern is that NETL overstates the GHG emissions from unconventional well completion. API compares NETL’s emission factor for unconventional well completions (9,000 Mcf of natural gas/episode) to the emission factor that EPA states in its 2014 GHG inventory (approximately 2,500 Mcf of natural gas/episode). EPA revised its unconventional completion emission factor between its 2013 and 2014 inventory reports, after NETL’s model

---

236 See id.

had been finalized and during the time that NETL was completing the LCA GHG Report. These factors are referred to as “potential emission factors” because they do not represent natural gas that is directly released to the atmosphere, but they represent the volume of natural gas that can be sent to flares and other environmental control equipment. NETL uses a potential emission factor of 9,000 Mcf of natural gas per each episode of shale gas hydraulic fracturing, and a potential emission factor of 3.6 Mcf of natural gas per each episode of liquids unloading (with 31 liquids unloading episodes per well-year). NETL’s model augments potential emission factors with flaring, thereby reducing the amount of methane that is released to the atmosphere. These emission factors are consistent with the findings of a survey jointly conducted by API and America’s Natural Gas Alliance and released in September 2012.\textsuperscript{238} They also match the factors used by EPA’s 2013 GHG inventory.\textsuperscript{239}

NETL’s current model accounts for liquids unloading emissions from conventional wells, but does not account for liquids unloading from unconventional wells. Applying liquids unloading to the unconventional wells in this analysis increases the life cycle GHGs by 0.6% for LNG export scenarios (using 100-year GWPs as stated in the IPCC Fifth Assessment Report). This 0.6% was estimated by assigning the liquid unloading emissions from onshore conventional natural gas to the upstream results for Marcellus Shale natural gas, followed by an expansion of the boundaries to a life cycle context. Simply put, liquids unloading accounts for 11% of the upstream GHG emissions from conventional onshore natural gas.\textsuperscript{240} When liquids unloading is added to unconventional natural gas in the LCA model, it is scaled according to the unique production rates and flaring practices of unconventional wells in addition to the subsequent flows

\textsuperscript{238} Characterizing Pivotal Sources of Methane Emissions from Natural Gas Production: Summary and Analysis of API and ANGA Survey Responses. Final Report (Sept. 21, 2012).
\textsuperscript{240} See NETL, Life Cycle Analysis of Natural Gas Extraction and Power Generation.
of natural gas processing, liquefaction, ocean transport, regasification, power plant operations, and electricity transmission. Thus, while liquids unloading may account for a significant share of upstream GHG emissions, none of the LCA GHG Report’s conclusions would change with the addition of liquids unloading to unconventional natural gas extraction.

The potential emissions from unconventional well completions are modeled as 9,000 Mcf of natural gas per episode. It is important to remember that this factor does not represent methane emissions directly released to the atmosphere, but the flow of natural gas prior to environmental controls. For unconventional natural gas, NETL’s model flares 15% of these potential emissions (flaring converts methane to CO₂, thus reducing the GWP of the gas) and apportions all completion emissions to a unit of natural gas by dividing them by lifetime well production (completion emissions occur as one-time episode that must be converted to a life cycle basis by amortizing them over total lifetime production of a well). Further, the life cycle GHG contributions from well completions are diluted when scaled to the subsequent flows of natural gas processing, liquefaction, ocean transport, regasification, power plant operations, and electricity transmission. However, in NETL’s model, life cycle completion emissions are directly affected by the estimated ultimate recovery (EUR) of a well because the total amount of natural gas produced by a well is used as a basis for apportioning completion and other one-time emissions to a unit of natural gas produced. From an engineering perspective, wells with high EURs are more likely to have a high initial reservoir pressure that increases the potential completion emissions. A reasonable uncertainty range around the potential emissions from unconventional completion emissions (9,000 Mcf/episode) is -30% to +50% (6,100 to 13,600 Mcf/episode). This uncertainty range matches the scale of uncertainty around the Marcellus Shale EUR used in the LCA GHG Report (see Table 5-4 of the LCA GHG Report). This -30%
to +50% uncertainty around potential emissions from unconventional completions causes a -2% to 3% uncertainty around life cycle GHG emissions for the export scenarios of this analysis.

The recently revised New Source Performance Standards (NSPS) rules for the oil and natural gas sector, which EPA amended in a final rule published on June 3, 2016,\textsuperscript{241} will achieve significant methane emission reductions primarily by requiring all new or modified wells to capture and control potential emissions of VOCs during natural gas well completion. In addition to well completion emissions, the NSPS rules target other point sources of VOC emissions from new and modified sources at natural gas extraction and processing sites, but they do not address liquids unloading.\textsuperscript{242} The LCA GHG Report does not account for the potential effects of the NSPS rules on natural gas emissions because the scope of the LCA accounts for GHG emissions from natural gas being produced today. EPA’s Regulatory Impact Analysis estimated that the final NSPS rule would reduce annual methane emissions in 2015 by 18 million metric tons, meaning that this rule will have the effect of reducing life cycle emissions from natural gas systems as new wells are developed and existing wells are modified. The likely effects of the NSPS rule therefore suggest that the conclusions of the LCA GHG Report are conservative with respect to the life cycle GHG emissions of natural gas produced in the United States.

Sierra Club contends that NETL’s documentation, including the 200-page supporting LCA document, does not clearly cite EPA’s Subpart W document. NETL’s Report has three references to Subpart W, cited as EPA 2011a, 2011b, and 2011c. These three references should

refer to the same document. Future versions of the Report will correct these duplicate citations. Sierra Club also calls out the citation for EPA, 2012c, although this is a correct reference that points to EPA’s documentation of New Source Performance Standards.

(3) **Coal Methane Data**

API and Concerned Citizens criticize the quality of data that DOE/NELT uses for coal extraction. In particular, API claims that coal mine methane emissions may be higher than the factors used by NETL. Concerned Citizens simply claim that NETL used a limited set of references to characterize coal mine emissions.

Methane emissions from coal mines are based on data collected by EPA’s Coalbed Methane Outreach Program and have been organized by coal type and geography. Due to data limitations, the LCA GHG Report used this data as a proxy for emissions from foreign coal. This limitation is noted in the LCA GHG Report and is accounted for by uncertainty. The bounds on coal methane uncertainty were informed by the variability in coal mine methane emissions between surface mines (subbituminous coal) and underground mines (bituminous coal) in the United States. The default parameters in NETL’s model represent subbituminous coal, which has lower coal mine methane emissions than bituminous coal (these parameters are specified in Table 5-3 of the LCA GHG Report). If coal mines in Europe and Asia emit methane at rates similar to the underground, bituminous coal mines in the United States, then the life cycle GHG emissions from coal power would increase. This increase in coal mine methane emissions would increase the life cycle GHG emissions of coal power by 8 percent (from 1,089 to 1,180 kg CO₂e/MWh, using 100-year GWPs as stated in the IPCC Fifth Assessment Report).

244 See, e.g., NETL, *Life Cycle Analysis of Natural Gas Extraction and Power Generation.*
This uncertainty is illustrated by Figure 6-16 in the LCA GHG Report. Again, even though changes to coal mine methane emissions change the GHG results of the LCA, they do not change the conclusions of the LCA.

5. Methane Leakage Rate Used in the LCA GHG Report

a. Comments

A number of commenters, including Sierra Club, Food & Water Watch, Americans Against Fracking et al., and Zimmerman and Associates, claim that the methane leakage rate used by NETL is too low. They assert that it does not match top-down (or aerial) measurements recently conducted in regions with natural gas activity, nor does it match the leakage rate in a recent analysis of wellhead casings in Pennsylvania.

b. DOE/FE Analysis

Recent studies lack consensus concerning the extent and rates of leakage from the upstream natural gas supply chain, with the leakage rates reported by these studies ranging from less than 1% to as high as 10%.245 One reason for this broad range of leakage rates is the fact that different analysts use different boundaries (e.g., extraction only, extraction through processing, extraction through transmission, and extraction through distribution). Further, top-down measurements are taken over narrow time frames and limited geographic scopes that represent only a snapshot of operations. They do not necessarily represent long-term operations over a broad area.

Another reason for this range of leakage rates is confusion between leaks and losses. Natural gas leaks include emissions from pneumatically controlled devices, valves, compressor seals, acid gas removal units, dehydrators, and flanges. These leaks are a mix of methane and

245 See NETL, *Life Cycle Analysis of Natural Gas Extraction and Power Generation* (Section 6.2.1) (identifying reports that include various leakage rates).
other hydrocarbons, and are a subset of total natural gas losses. Another type of loss includes flaring, which converts methane to CO₂ and thus reduces methane venting to the atmosphere. Similarly, the combustion of natural gas by reboilers in a natural gas processing plant or by compressors on a pipeline represents the loss of natural gas that is used to improve the purity of the gas itself and move it along the transmission network.

NETL’s expected cradle-through-transmission leakage rate is 1.2%. In other words, the extraction, processing, and transmission of 1 kg of natural gas releases 0.012 kg of CH₄ to the atmosphere. In contrast, NETL’s expected loss rate from the same boundary is approximately 8%: for the delivery of 1 kg of natural gas via a transmission pipeline, 0.012 kg of CH₄ is released to the atmosphere, and 0.068 kg is flared by environmental controls or combusted for processing and transmission energy.

Sierra Club compares NETL’s leakage rate to a 1.54% leakage rate derived from EPA’s 2013 GHG inventory. The two types of leakage rates (the 1.2% calculated by NETL’s life cycle model and the 1.54% implied by EPA’s 2013 inventory) are not directly comparable. LCAs and national inventories have different temporal boundaries. NETL’s leakage rate is a life cycle number based on a 30-year time frame; it levelizes the emissions from one-time well completion activities over a 30-year time frame of steady-state production. The leakage rate implied by EPA’s inventory represents 2011 industry activity; it captures the spike in completion emissions due to the atypically high number of wells that were completed that year. In other words, national inventories calculate all emissions that occur in a given year, while LCAs apportion all emissions that occur during a study period (e.g., 30 years) to a unit of production (e.g., 1 MWh of electricity generated). Both approaches are legitimate with respect to the unique goals of each type of analysis.
Sierra Club also compares NETL’s 1.2% leakage rate to the 2.01% leakage rate calculated by Burnham et al.\textsuperscript{246} Again, a boundary difference explains why the two leakage rates are not directly comparable. Burnham et al.’s leakage rate includes natural gas distribution, which is an additional transport step beyond transmission. Natural gas distribution moves natural gas from the “city gate” to small scale end users (commercial and residential consumers). NETL’s leakage rate ends after natural gas transmission, the point at which natural gas is available for large scale end users such as power plants. The natural gas distribution system is a highly-branched network that uses vent-controlled devices to regulate pressure. This boundary difference explains why Burnham et al.’s leakage rate is higher than NETL’s rate. Sierra Club also compares NETL’s leakage rate to a shale gas analysis conducted by Weber et al.\textsuperscript{247} We have reviewed Weber et al.’s work and do not see any mention of leakage rate.

It is also important to note that leakage rate is not an input to NETL’s life cycle model. Rather, it is calculated from the outputs of NETL’s life cycle model. NETL uses an approach that assembles all activities in the natural gas supply chain into a network of interconnected processes. The emissions from each process in this model are based on engineering relationships and emission factors from the EPA and other sources. This method is known as a “bottom-up” approach. Researchers are trying to discern why “top-down” studies such as Pétron’s measurements in northeast Colorado\textsuperscript{248} do not match the bottom-up calculations by NETL and other analysts. We believe that inconsistent boundaries (\textit{i.e.}, bottom-up models that account for long term emissions at the equipment level in comparison to top-down measurements that

encompass an entire region with more than one type of industrial activity over a narrow time frame) partly explain the differences between bottom-up and top-down results. As research continues, however, we expect to learn more about the differences between bottom-up and top-down methods.

Zimmerman and Associates references a recent study by Ingraffea et al. that assessed failure rates of well casings for oil and gas wells in Pennsylvania. However, Ingraffea et al. do not calculate a methane leakage rate in their analysis; rather, they calculate the rate at which wells develop leaks. The rate at which leaks develop in well casings is a different phenomenon than the rate at which methane leaks from the natural gas supply chain. The former is a measurement of failure rates (the number of wells in a group that have leaks) and the latter is a measurement of the magnitude of total leakage (the amount of methane in extracted natural gas that is released to the atmosphere).

The breakeven analysis shown in Section 6 of the LCA GHG Report models hypothetical scenarios that increase the natural gas leakage rate to the point where the life cycle emissions from natural gas power are the same as those from coal power. The breakeven points between natural gas and coal systems are illustrated in Figures 6-8 and 6-9 of the Report. These results are based on the most conservative breakeven point, which occurs between the high natural gas cases (i.e., lowest power plant efficiency, longest transport distance, and highest methane leakage) with the low coal case (i.e., highest power plant efficiency and shortest transport distance). These graphs show that on a 100-year GWP basis, methane leakage would have to increase by a factor of 1.7 to 3.6, depending on the scenario, before the breakeven occurs. The

---

breakeven methane leakage is lower for the 20-year GWP basis and, for some scenarios, is lower than the modeled leakage rate.

6. The Uncertainty Bounds of the LCA GHG Report

   a. Comments

   Concerned Citizens claim that the LCA GHG Report has significant uncertainty, and contend that “poor modeling is not a reason to dismiss impacts.”

   b. DOE/FE Analysis

   The results of the LCA GHG Report are based on a flexible model with parameters for natural gas extraction, processing, and transport. Uncertainty bounds are assigned to three key parameters: well production rates, flaring rates, and transport distances. These uncertainty bars are not an indication of poor modeling. To the contrary, they are used to account for variability in natural gas systems. If the analysis did not account for uncertainty, the results would imply that the GHG emissions from natural gas systems are consistently a single, point value, which would be inaccurate. We therefore believe the chosen uncertainty bounds strengthen the LCA model, as opposed to indicating any weakness in modeling.

7. The LCA GHG Report and the NEPA Approval Process

   a. Comments

   Several commenters, including Citizens Against LNG, Dominion Cove Point LNG, Susan Sakmar, and Americans Against Fracking et al., note that the LCA GHG Report does not fulfill the requirements of an EIS as defined by NEPA. These commenters maintain that the LCA GHG Report should not be used as a basis for approving proposed LNG export terminals.

   b. DOE/FE Analysis

   We agree that the LCA GHG Report does not fulfill any NEPA requirements in this proceeding, nor has DOE/FE made any suggestion to that effect. The LCA GHG Report
addresses foreign GHG emissions and thus goes beyond the scope of what must be reviewed under NEPA.

XI. FERC PROCEEDING AND GRANT OF AUTHORIZATION

A. FERC’s Pre-Filing Procedures

Authorizations issued by FERC permitting the siting, construction, and operation of LNG export terminals are reviewed under NGA section 3(a) and (e), 15 U.S.C. § 717b(a), (e). FERC’s approval process for such an application consists of a mandatory pre-filing process during which the environmental review required by NEPA commences, and a formal application process that starts no sooner than 180 days after issuance of a notice that the pre-filing process has commenced.

On March 20, 2013, FERC began its pre-filing review of the Magnolia LNG Project and established pre-filing Docket No. PF13-9-000 to place information related to the Project into the public record. On June 18, 2013, FERC issued a Notice of Intent to Prepare an Environmental Impact Statement (NOI) for the proposed Liquefaction Project.

DOE agreed to participate as a cooperating agency in FERC’s environmental review. Consistent with its practice, FERC published the NOI in the Federal Register and mailed it to federal, state, and local government representatives and agencies, elected officials, environmental and public interest groups, Native American Tribes, property owners in the

---

252 FERC Order at P 48.
254 FERC Order at P 52; see also 40 C.F.R. §1501.6 (“In addition, any other Federal agency which has special expertise with respect to any environmental issue, which should be addressed in the statement may be a cooperating agency upon request of the lead agency.”); id. § 1501.6(b) (responsibilities of a cooperating agency).
vicinity of the proposed facilities, other interested parties, and local libraries and newspapers. As part of FERC’s public scoping process under NEPA, FERC held open houses and received comments from a variety of stakeholders, which served to identify issues for FERC staff to address in the EIS.

**B. FERC’s Environmental Review**

On April 30, 2014, Magnolia LNG began the second part of FERC’s approval process by filing its formal application in FERC Docket No. CP14-347-000 for authorization to site, construct, and operate the Liquefaction Project under NGA section 3. Subsequently, Kinder Morgan Louisiana Pipeline LLC filed a separate application in FERC Docket No. CP14-511-000, for a certificate of public convenience and necessity to construct and operate pipeline and compression facilities in Acadia, Calcasieu and Evangeline Parishes, Louisiana (Lake Charles Expansion Project) pursuant to NGA section 7(c). According to FERC, the Lake Charles Expansion Project will make Kinder Morgan Louisiana’s existing pipeline facilities bi-directional, enabling it to transport domestically produced natural gas to the Magnolia LNG Project for processing, liquefaction, and export. FERC therefore joined the two dockets for purpose of its environmental review and decision-making.

FERC issued a Draft Environmental Impact Statement (DEIS) for the Liquefaction Project on July 17, 2015, and placed the DEIS into the public record. Based on the FERC staff’s analysis, public scoping, and agency consultation, FERC addressed numerous potential

---

255 FERC Order at P 48.
256 See id. at PP 48-49.
259 FERC Order at P 2 (FERC’s rationale for treating the projects within a single environmental review and order).
260 FERC Order at P 53 (citation omitted).
impacts of the Project in the DEIS, including (but not limited to) wetlands, geological conditions, water resources, air quality, and cumulative impacts.\textsuperscript{261}

In accordance with CEQ’s NEPA regulations, FERC provided a 45-day public comment period on the DEIS. During this time, FERC held a public meeting and accepted written comments on the draft EIS from federal and state agencies, as well as other interested parties, including the applicants. In total, FERC received seven written comments on the draft EIS.\textsuperscript{262}

On November 13, 2015, the FERC staff issued the final EIS for the Magnolia LNG Liquefaction Project and Lake Charles Expansion Project. The final EIS responds to comments received on the draft EIS. It addresses the potential impacts of the Project on geology; soils; water resources; wetlands; vegetation; wildlife and aquatic resources; threatened, endangered, and other special status species; land use, recreation, and visual resources; socioeconomics; cultural resources; air quality and noise; reliability and safety; and cumulative impacts.\textsuperscript{263} The EIS also reviewed alternatives to the proposed action.\textsuperscript{264}

Based on its environmental analysis, FERC staff concluded that, “construction and operation of the proposed projects would result in adverse environmental impacts, but impacts would be reduced to less-than-significant levels with the implementation of the applicants’ proposed and our recommended mitigation measures.”\textsuperscript{265} FERC staff identified 114

\textsuperscript{261} See Draft EIS at ES-2.
\textsuperscript{262} FERC Order at P 53.
\textsuperscript{263} Final EIS at ES-3.
\textsuperscript{264} Final EIS at ES-14.
\textsuperscript{265} Id. at ES-15; see also FERC Order at P 56.
environmental mitigation measures, which it recommended that FERC attach as conditions to any authorization of the Liquefaction Project.266

C. FERC’s Order Granting Authorization

1. Overview

On April 15, 2016, FERC issued its Order authorizing Magnolia LNG and Kinder Morgan Louisiana to site, construct, and operate the Liquefaction Project and the associated Pipeline Project, pursuant to NGA section 3(a) and 7(c), respectively.267

In granting this authorization, FERC observed that the proposed site for the Magnolia LNG Terminal is an area zoned for heavy industrial use on the Port of Lake Charles, and that Magnolia LNG’s operations will be consistent with those of the other industrial facilities along the shoreline in that area.268 Based on its review of the record, including the final EIS, FERC determined that “most of the direct environmental impacts from construction of the proposed facilities are expected to be temporary or short term.”269

FERC further found that “most other impacts from construction and operation … will be reduced to less than significant levels” if, in relevant part, the projects are constructed and operated in accordance with the environmental mitigation measures recommended in the EIS and adopted by the Order.270 On this basis, FERC adopted the 114 environmental mitigation measures recommended in the EIS. In addition, FERC adopted its own additional condition, bringing the total number of environmental conditions to 115. This additional condition, listed

266 See Final EIS at ES-16; see also id. at 5-28 through 5-44.
267 See FERC Order at PP 1-3.
268 See id. at P 23.
269 Id.
270 Id.; see also id. at P 118 (FERC concluding that “approval of the proposed facilities, if constructed and operated as described in the final EIS, is an environmentally acceptable action”).
as number 95 in the Appendix to the FERC Order, pertains to Magnolia LNG’s first commissioning cargoes and weekly reports regarding its commissioning activities.  

2. Greenhouse Gas Emissions

FERC observed that EPA had filed comments on the draft EIS—and again in response to the final EIS—requesting that FERC consider the GHG emissions associated with the production, transport, and combustion of the natural gas proposed to be exported.  FERC responded that, in the final EIS, FERC staff “considered the GHG emissions associated with the project and the potential impacts related to climate change, but noted that there is no methodology to determine how the project’s incremental contribution to GHGs would affect climate change.” According to FERC, the final EIS also recognized that end users would emit GHGs, but determined that “the emissions could not be attributed to the project because fuel-supply is demand-driven.” FERC reasoned that end users would have a need for fuel regardless of the Liquefaction Project, and would obtain natural gas from another source or another fuel if necessary.  

FERC also rejected EPA’s recommendation that the draft EIS should have included calculations of GHG emissions from end use of the natural gas exported by the proposed Liquefaction Project, as did the draft EIS for the proposed Jordan Cove Energy and Pacific Connector Gas Pipeline Project in Oregon. According to FERC, the State of Louisiana (unlike the State of Oregon in the Jordan Cove proceeding) did not undertake and file a life-cycle GHG analysis in the Magnolia LNG proceeding, nor is there record evidence in the proceeding.

272 See id. at PP 90-91.
273 Id. at P 90.
274 FERC Order at P 90.
275 See id.
276 See id. at P 91.
regarding the expected destination of the LNG as there was in the Jordan Cove proceeding.\textsuperscript{277} FERC further stated that “any life-cycle analysis of the emissions from LNG vessel transits to possible markets or the emissions from the end use combustion of natural gas are too speculative to permit any meaningful consideration.”\textsuperscript{278} For these reasons, FERC disagreed with EPA’s suggestion “as it would require [FERC] to engage in speculative analyses and provide information that will not meaningfully inform the decision-making process.”\textsuperscript{279}

Next, FERC addressed claims that it should consider DOE’s Addendum and LCA GHG Report, discussed herein, as part of its decision-making under NGA section 3. In FERC’s view, the Addendum and LCA GHG Report “provide general estimates about the environmental impacts associated with natural gas production and end use,” but those impacts “are not specific to the proposals before us.”\textsuperscript{280} Quoting DOE’s statements in the Addendum, FERC maintained that “in the absence of information regarding where and when additional [natural] gas production will arise, the environmental impacts of such production ‘are not reasonably foreseeable within the meaning of the CEQ’s NEPA regulations,’ and ‘cannot [be] meaningfully analyze[d].’”\textsuperscript{281}

FERC further observed that, “to the extent that natural gas production replaces the use of other carbon-based energy sources, DOE found [in the Addendum] that there may be a net positive impact in terms of climate change.”\textsuperscript{282} Turning to DOE’s LCA GHG Report, FERC pointed to DOE’s conclusion that “U.S. LNG exports for power production in European and

Asian markets will not increase life-cycle GHG emissions, when compared to regional coal extraction and consumption for power production.”

3. Induced Natural Gas Production

FERC addressed comments filed by EPA “recommending that the final EIS consider the potential for increased natural gas production and associated increased environmental impacts resulting from the Magnolia terminal.” Specifically, “EPA stated that the DOE Addendum [discussed herein], which analyzes these types of impacts, should be considered in the Commission’s analysis.”

In response to these comments, FERC stated that the final EIS did not include an analysis of the indirect impacts of induced natural gas production. FERC stated that “while DOE’s Addendum included a broad analysis of the types of resources from which additional production would occur, it did not specifically analyze impacts from the Magnolia and Lake Charles Expansion Projects.” FERC further stated that DOE “cannot meaningfully estimate where, when, or by what method any additional natural gas would be produced,” nor can it meaningfully analyze[] the specific environmental impacts of such production, which are nearly all local or regional in nature.”

FERC notes that, on December 21, 2015, EPA filed comments stating that the final EIS did not fully consider its prior recommendations regarding the indirect effects of natural gas production and associated environmental impacts, and again asked FERC to consider them in its

---

284 See id. at P 107 & n.96 (noting that Sierra Club, among other commenters, filed comments prior to issuance of the NOI opposing Magnolia’s and Kinder Morgan Louisiana’s proposals on the grounds “they would facilitate the exportation of gas and thereby induce additional gas production activities with adverse environmental impacts”).
285 Id.
286 See id. at P 108.
287 FERC Order at P 108.
288 Id.
decision-making for the Magnolia Project. Disagreeing with EPA, FERC observed that “[i]ndirect impacts are defined [in the CEQ’s NEPA regulations] as those ‘which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable.’” According to FERC, to determine whether an impact should be studied as an indirect impact, FERC “must determine whether it: (1) is caused by the proposed action; and (2) is reasonably foreseeable.” Based on the meaning of both causation and “reasonably foreseeable,” as developed in caselaw, FERC concluded that it “does not have jurisdiction over natural gas production.”

Specifically, FERC determined that “the potential environmental effects resulting from natural gas production are not sufficiently causally related to the Magnolia and Lake Charles Expansion Projects to warrant a detailed analysis, nor are the potential environmental impacts reasonably foreseeable” pursuant to CEQ’s regulations. FERC reasoned that “[t]he potential impacts of natural gas production, with the exception of greenhouse gases and climate change, would be localized.” FERC pointed out, among other considerations, that “[e]ach locale includes unique conditions and environmental resources,” such that “[p]roduction activities are … regulated at a state and local level.”

In FERC’s view, a causal relationship sufficient to warrant its analysis of the non-pipeline activity as an “indirect impact” would exist only if: (i) “the proposed pipeline would transport new production from a specified production area,” and (ii) “that production would not occur in the absence of the proposed pipeline (i.e., there will be no other way to move the

295 Id.
FERC asserted that, to date, it “has not been presented with a proposed pipeline project that the record shows will cause the predictable development of natural gas reserves.”

Rejecting the claim that potential environmental impacts resulting from natural gas production are “reasonably foreseeable” under NEPA, FERC next asserted that it “generally does not have sufficient information to determine the origin of the [natural] gas that will be transported on a pipeline.” According to FERC, the states—not FERC itself—have jurisdiction over the production of natural gas, and thus would be most likely to have the information necessary to reasonably foresee future production. FERC is “aware of no forecasts by such entities, making it impossible for the Commission to meaningfully predict production-related impacts, many of which are highly localized.” FERC argued that, even if it knew the general source areas of natural gas likely to be transported on a given pipeline, “a meaningful analysis of production impacts would require more detailed information regarding the number, location, and timing of wells, roads, [and] gathering lines, … as well as details about production methods, which can vary per producer and depending on the applicable regulations in the various states.” FERC thus concluded that the impacts of natural gas production are “so nebulous’ that we ‘cannot forecast [their] likely effects’ in the context of an environmental analysis of the impacts related to a proposed interstate natural gas pipeline.”

Analyzing the proposed Magnolia Project, FERC noted that the studies and reports cited by EPA are “broad and do not show where or when additional development will occur if the

302 Id. (quoting Habitat Educ. Ctr. v. U.S. Forest Serv., 609 F.3d 897, 902 (7th Cir. 2010)).
project is approved.”  FERC therefore concluded that, where “it is not known whether the Magnolia and Lake Charles Expansion Projects will use natural gas derived from new production, and that the amount, timing, and location of any development is also unknown, the impact from induced natural gas production is not an indirect effect of the projects.”

4. Cumulative Impacts

FERC determined that most of the cumulative impacts of the proposed Liquefaction Project identified in the final EIS will be minor or insignificant. In the final EIS, FERC staff found that the greatest potential for cumulative impacts is on socioeconomic conditions and land transportation—specifically, “concurrent construction of the proposed project with other projects in the area will result in increased workers in the area, which could exceed available housing and result in impacts on public services and transportation.”  FERC therefore stated that some workers may be required to obtain housing in more distant parishes with longer commutes, causing (among other issues) increased traffic in the vicinity of the Project. Other working housing developments are either planned or under construction to accommodate the workers.

In terms of positive benefits associated with this large workforce, FERC noted, however, that the large workforce associated with simultaneously constructed projects would have a beneficial cumulative effect on revenues and property taxes for the State of Louisiana and/or affected parishes. Therefore, on the basis of the environmental mitigation measures adopted as conditions of FERC’s authorizations, FERC agrees with the conclusions of the final EIS that

305 Id. at P 102.
306 See id. at P 103.
307 See id. at PP 103.
“the overall cumulative impact on public services is expected to be minor” and the “cumulative impacts on roadway and marine traffic will be moderate.”

5. Environmental Conclusions

In granting the authorization, FERC “agree[d] with the conclusions presented in the final EIS and [found] that approval of the proposed facilities, if constructed and operated as described in the final EIS, is an environmentally acceptable action.” On that basis, FERC adopted 115 environmental mitigation measures as conditions to the Magnolia and Kinder Morgan Louisiana authorizations granted in the Order.

D. Request for Rehearing of FERC Order

On May 16, 2016, Sierra Club filed a timely requested rehearing of the FERC Order. FERC granted rehearing for purposes of further consideration on June 13, 2016, and denied rehearing on November 23, 2016.

XII. DISCUSSION AND CONCLUSIONS

In reviewing Magnolia LNG’s Application to export LNG, DOE/FE has considered both its obligations under NEPA and its obligation under NGA section 3(a) to ensure that the proposed LNG exports are not inconsistent with the public interest. To accomplish these purposes, DOE/FE has examined a wide range of information addressing environmental and non-environmental factors, including:

- Magnolia LNG’s Application, API’s motion and the comments filed in support of the Application, the submissions of Sierra Club and APGA opposing the Application, and Magnolia LNG’s Answer;

---

308 Id. at PP 104, 106.
309 FERC Order at P 118.
310 See supra § I. FERC imposed an additional condition for a total of 115 environmental conditions- See FERC Order at P 97 (explaining the inclusion of an additional condition, Environmental Condition 95).
311 See supra note 27.
• FERC’s EIS and April 15, 2016 Order, including the 115 conditions adopted in that Order;

• The Draft Addendum, comments received in response to the Draft Addendum, and the final Addendum;

• The LCA GHG Report (and the supporting NETL document), including comments submitted in response to those documents; and

• The 2014 and 2015 LNG Export Studies, including comments received in response to those Studies.

To avoid repetition, the following discussion focuses on arguments and evidence presented by Magnolia LNG, intervenor API supporting the Application, and the two intervenor-protestors opposing the Application (Sierra Club and APGA), to the extent that DOE/FE has not already addressed the same or substantially similar arguments in its responses to comments on the Addendum, the LCA GHG Report, and/or the 2014 and 2015 Studies.

A. Motions to Intervene

API timely filed a motion to intervene in this proceeding. Magnolia LNG did not oppose API’s motion and, therefore, API’s motion to intervene is deemed granted. 10 C.F.R. § 590.303(g); see infra § XV (Ordering Para. S).

Additionally, we find good cause to grant the motions to intervene submitted by Sierra Club and APGA. Magnolia LNG filed an answer opposing both motions on the basis that (among other reasons) the proposed intervenors were “recycling” arguments that had been addressed or rejected by DOE in prior LNG export proceedings. We find, however, that the evidence presented in this proceeding, as well as in the 2014 and 2015 LNG Export Studies, indicate that the economic consequences of granting the Application could be far-reaching and could affect the interests of Sierra Club, APGA, and their members. This fact alone is good cause to permit their intervention. In addition, Sierra Club and APGA each raised a number of issues that are relevant to the public interest and addressed herein. Magnolia LNG was afforded
an opportunity to respond to Sierra Club’s and APGA’s arguments pursuant to 10 C.F.R. § 590.304(f), and did so. Accordingly, we will grant the motions to intervene. See infra § XV (Ordering Para. T).

**B. Non-Environmental Issues**

In considering non-environmental issues in this proceeding, we have reviewed the Application, including the Berkeley Research Group (BRG) Report submitted by Magnolia LNG; the pleadings and comments submitted in this proceeding; and the 2014 and 2015 LNG Export Studies and comments thereto. We also take administrative notice of EIA’s more recent authoritative supply data and projections, set forth in AEO 2015 and AEO 2016 and discussed below.

**1. Magnolia LNG’s Application**

Magnolia LNG’s Application, as well as API’s supporting motion to intervene, review natural gas supply and demand conditions in the United States and the likely impact that the proposed exports will have on natural gas prices. Magnolia LNG relies on the BRG Report, EIA estimates, and the NERA Study (conducted as part of DOE’s 2012 LNG Export Study) in stating that the United States has significant natural gas resources available to meet both projected future domestic needs and supply gas for the proposed exports with only a modest incremental impact on domestic natural gas prices. Magnolia LNG also asserts that the proposed exports will yield significant local, regional, and national economic benefits and will generate additional international benefits.

Sierra Club and APGA have argued that Magnolia LNG’s conclusions are unfounded. In particular, they each contend that the proposed exports would not yield economic benefits but, in fact, would increase natural gas prices significantly and result in other deleterious economic and societal impacts. To counter the 2012 LNG Export Study, Sierra Club refers to a study from
2013, which it calls the “Purdue Study” but is actually titled a “Working Paper.” However, by Sierra Club’s own admission, this working paper is unpublished.

Both APGA and Sierra Club maintain that exports of LNG have the potential to drastically affect total U.S. natural gas supply. Sierra Club further contends that EIA’s export scenarios in the 2012 LNG Export Study are “too low.” Accordingly, Sierra Club and APGA contend that the proposed exports, and U.S. LNG exports generally, will result in significantly higher natural gas prices domestically than projected by Magnolia LNG. Sierra Club also challenges the sustainability of economic benefits in regions tied to resource extraction industries, as discussed below.

EIA’s most recent projections in AEO 2016 provide independent support for the proposition that domestic supplies will be adequate both to meet domestic needs and to supply Magnolia LNG’s exports and other final non-FTA LNG exports previously authorized by DOE/FE. See supra § VIII.A. Further, Magnolia LNG and each of the commenters assert that the proposed exports will benefit the local economy in and around Calcasieu Parish, Louisiana; Louisiana’s state economy; the Gulf Coast regional economy; and the greater national economy. These conclusions are bolstered by the 2014 and 2015 LNG Export Studies. Accordingly, we find that the evidence shows that the market will be capable of sustaining the level of exports proposed in the Application over the term of the requested authorization without significant negative price or other impacts. For these reasons, as further discussed below, we find that APGA and Sierra Club have not overcome the statutory presumption that the requested exports are consistent with the public interest.

---

312 Sierra Club Mot. at 71.
313 See id. at n.285.
314 Id. at 33.
2. Regional Impacts

Magnolia LNG asserts that the proposed exports will stimulate local, regional, and national economies through direct and indirect job creation, increased economic activity, and tax revenues. The opponents of the Application attempt to counter these claims.

APGA contends that the NERA Study, conducted as part of the 2012 LNG Export Study, concludes that price increases resulting from LNG exports will hurt consumers of natural gas and electricity. APGA is also concerned that exports of LNG will undercut a manufacturing renaissance in the United States and, in particular, will disadvantage the petrochemical industry for which natural gas is a significant cost component. APGA maintains that the United States should pursue policies that allow industry to invest in manufacturing industries rather than LNG export facilities because manufacturing provides a value-added benefit to the economy that multiplies the value of every dollar spent on natural gas.

Sierra Club makes several of the same arguments raised by APGA—specifically, it asserts that “net domestic job losses and economic harm to most Americans” resulting from LNG exports will “overwhelm[]” the purported economic benefits Magnolia asserts.” Sierra Club also challenges the sustainability of economic benefits in regions tied to resource extraction industries, focusing principally on the durability of economic benefits in producing regions in Pennsylvania and New York where Marcellus Shale drilling is occurring. Sierra Club asserts that any “boom” in economic activity will be followed by a bust, and that the prospect of such an event demonstrates that a grant of the requested authorization is inconsistent with the public interest.

315 Id. at 4.
We note that certain commenters on the 2014 and 2015 LNG Export Studies make several of the same arguments raised by APGA and Sierra Club, challenging the sustainability of economic benefits in regions tied to resource extraction industries. In particular, these commenters contend that DOE/FE must consider a full range of counterfactual scenarios by evaluating whether the nation would be better off without LNG export, or with lower export volumes. They likewise challenge claimed regional economic benefits and assert that any “boom” in economic activity will result in a “bust” to the detriment of the public interest.

On review, we do not agree with APGA and Sierra Club that Magnolia LNG’s proposed exports will not yield net economic benefits or that the proposed exports will produce deleterious economic and societal impacts. The 2014 and 2015 LNG Export Studies, as well as EIA’s supply data and projections in AEO 2015 and AEO 2016, show that the proposed exports are likely to generate net economic benefits for the United States. Further, we note that, in responding to the Notice of Application, neither APGA nor Sierra Club offered detailed analyses specific to the local and regional economic impacts of Magnolia LNG’s proposal to contradict this evidence.

To the extent that Sierra Club, APGA, or other commenters are claiming that the exports proposed by Magnolia LNG will physically exhaust existing resources (i.e., resulting in a “bust”), we refer to the section above in which we conclude that record evidence indicates that there will be substantial supply into the foreseeable future. To the extent they allege that “bust” cycles will be brought on by price declines that render existing natural gas resources uneconomic to produce, we do not see compelling evidence that the exports will exacerbate this risk. If anything, it seems more likely that Magnolia LNG’s ability to export to non-FTA countries will
deepen and diversify the market for U.S.-produced natural gas, making the potential for a precipitous price-driven downturn in production activities less likely, not more likely.

Finally, we reject the claims that exports will have a negative impact on employment. Sierra Club points to a study conducted by Weinstein and Partridge (the Weinstein study) to support its position. However, we have considered the analysis contained in the Weinstein study in several LNG export orders, and found that the Weinstein Study showed only a statistically insignificant decline in employment in the regions studied in the years before a drilling boom (2001 to 2005), compared to the years during the drilling boom (2005 to 2009). This small decline could have been the result of other factors, particularly since the years of the drilling boom coincided with a national economic recession. On the other hand, comparing the same time periods, we found that the Weinstein study showed substantial gains in economic growth rates in counties with drilling operations as opposed to those without. For the same reasons provided in those orders, we reject Sierra Club’s arguments here.

3. Price Impacts

As discussed above, the 2014 and 2015 LNG Export Studies projected the economic impacts of LNG exports in a range of scenarios, including scenarios that exceeded the current amount of LNG exports authorized in the final non-FTA export authorizations to date (equivalent to a total of 16.30 Bcf/d of natural gas with the issuance of this Order). The 2015 Study concluded that LNG exports at these levels (12 to 20 Bcf/d of natural gas) would result in

---

316 Sierra Club Mot. at 68 & n.274 (discussing Weinstein and Partridge, The Economic Value of Shale Natural Gas in Ohio, Ohio State University, Swank Program in Rural-Urban Policy Summary & Report (Dec. 2010)).
318 See id.
319 See infra § XII.D.
higher U.S. natural gas prices, but that these price changes would remain in a relatively narrow range across the scenarios studied. However, even with these estimated price increases, the 2015 Study found that the United States would experience net economic benefits from increased LNG exports in all cases studied.\footnote{See 2015 Study at 8, 82.}

We have also reviewed EIA’s AEO 2016, published in June 2016. The Reference case of this projection includes the effects of the Clean Power Plan (CPP), discussed supra, which is intended to reduce carbon emissions from the power sector. DOE/FE assessed the AEO 2016 to evaluate any differences from AEO 2014, which formed the basis for the 2014 Study.

Comparing key results from 2040 (the end of the projection period in Reference case projections from AEO 2014 and AEO 2016) shows that the latest Outlook foresees market conditions that would be even more supportive of LNG exports, including higher production and demand coupled with lower prices. Results from EIA’s AEO 2016 no-CPP case, which is the same as the Reference case but does not include the CPP, are also more supportive of LNG exports on the same basis of higher production and demand with lower prices relative to AEO 2014.

For the year 2040, the AEO 2016 Reference case anticipates 15 percent more natural gas production in the lower-48 than AEO 2014. It also projects an average Henry Hub natural gas price that is lower than AEO 2014 by nearly 40 percent. With regard to exports, the 2016 projection’s 2040 net pipeline exports of 2.4 Bcf/d and total LNG exports of 18.4 Bcf/d (over 90 percent higher than total LNG exports in AEO 2014) illustrate the Outlook’s view of a market environment supportive of exports.
In the AEO 2016 no-CPP case, for the year 2040, lower-48 production is almost 14 percent higher than in AEO 2014, with the Henry Hub price over 42 percent lower. Net pipeline exports of 2.8 Bcf/d and total LNG exports of 18.6 Bcf/d again indicate a market supportive of exports. These differences are depicted in the table below:

3. **Significance of the 2014 and 2015 LNG Export Studies**

For the reasons discussed above, DOE/FE commissioned the 2014 EIA LNG Export Study and the 2015 LNG Export Study, and invited the submission of responsive comments on both Studies. DOE/FE has analyzed this material and determined that these two Studies provide substantial support for granting Magnolia LNG’s Application. Specifically, the conclusion of the 2015 Study is that the United States will experience net economic benefits from issuance of authorizations to export domestically produced LNG.

We have evaluated the public comments submitted in response to the 2014 and 2015 LNG Export Studies. Certain commenters have criticized aspects of the models, assumptions, and design of the Studies. As discussed above, however, EIA’s projections in AEO 2016 continue to show market conditions that will accommodate increased exports of natural gas. When compared to the AEO 2014 Reference case, the AEO 2016 Reference case projects increases in domestic natural gas production—well in excess of what is required to meet projected increases in domestic consumption. Accordingly, we find that the 2014 and 2015 LNG Export Studies are fundamentally sound and support the proposition that the proposed authorization will not be inconsistent with the public interest.

4. **Benefits of International Trade**

We have not limited our review to the contents of the 2014 and 2015 LNG Export Studies and the data from AEO 2015 and AEO 2016, but have considered a wide range of other information. For example, the National Export Initiative, established by Executive Order and cited by Magnolia LNG, sets an Administration goal to “improve conditions that directly affect
the private sector’s ability to export” and to “enhance and coordinate Federal efforts to facilitate the creation of jobs in the United States through the promotion of exports.”

We have also considered the international consequences of our decision. We review applications to export LNG to non-FTA nations under section 3(a) of the NGA. The United States’ commitment to free trade is one factor bearing on that review. An efficient, transparent international market for natural gas with diverse sources of supply provides both economic and strategic benefits to the United States and our allies. Indeed, increased production of domestic natural gas has significantly reduced the need for the United States to import LNG. In global trade, LNG shipments that would have been destined to U.S. markets have been redirected to Europe and Asia, improving energy security for many of our key trading partners. To the extent U.S. exports can diversify global LNG supplies, and increase the volumes of LNG available globally, it will improve energy security for many U.S. allies and trading partners. As such, authorizing U.S. exports may advance the public interest for reasons that are distinct from and additional to the economic benefits identified in the 2014 and 2015 Studies.

C. Environmental Issues

In reviewing the potential environmental impacts of Magnolia LNG’s proposal to export LNG, DOE/FE has considered both its obligations under NEPA and its obligation under NGA section 3(a) to ensure that the proposal is not inconsistent with the public interest.

1. Adoption of FERC’s Final EIS

DOE/FE participated in FERC’s environmental review of the proposed Magnolia LNG Liquefaction Project as a cooperating agency and has examined the arguments submitted by the intervenors who challenged FERC’s reasoning and conclusions. Because DOE was a cooperating

---

agency, DOE/FE is permitted to adopt without recirculating FERC’s final EIS for the Liquefaction Project, provided that DOE/FE has conducted an independent review of the EIS and determines that its comments and suggestions have been satisfied.\textsuperscript{322} For the reasons set forth below, DOE/FE has not found that the arguments raised in the FERC proceeding, the current proceeding, or the 2014 and 2015 LNG Export Study proceedings detract from the reasoning and conclusions contained in the final EIS. Accordingly, DOE has adopted the EIS (DOE/EIS-0498),\textsuperscript{323} and hereby incorporates the reasoning contained in the EIS in this Order.

2. Scope of NEPA Review

In the proceeding before FERC, EPA filed comments on the draft EIS recommending that the final EIS consider the potential for increased natural gas production and associated increased environmental impacts resulting from the proposed Magnolia LNG Terminal. “Specifically, EPA stated that the DOE Addendum … should be considered in [FERC’s] analysis.”\textsuperscript{324} Additionally, Sierra Club filed comments opposing Magnolia LNG’s proposal prior to issuance of the NOI to prepare an EIS, stating that the Project “would facilitate the exportation of natural gas and thereby induce additional natural gas production activities with adverse environmental consequences.”\textsuperscript{325}

As discussed above, FERC staff responded to EPA’s comments on the draft EIS by including in the final EIS an analysis of the potential for environmental impacts from induced natural gas production. The EIS concluded that a detailed environmental analysis of increased natural gas production would be too speculative for inclusion in the final EIS because the impact of such increased production cannot be described with sufficient specificity to make its consideration useful to reasoned decision makers. In its April 15, 2016 Order, FERC found that

\textsuperscript{322} See 40 C.F.R. § 1506.3(c).
\textsuperscript{323} See supra § I (citing 81 Fed. Reg. 67,348).
\textsuperscript{324} FERC Order at P 107.
\textsuperscript{325} Id. at P 107 & n.96.
such increased production is not “reasonably foreseeable” within the meaning of NEPA.\textsuperscript{326} We find that FERC’s environmental review covered all reasonably foreseeable environmental impacts of the proposed Liquefaction Project,\textsuperscript{327} and that NEPA does not require the review to include induced upstream natural gas production.

Fundamental uncertainties constrain our ability to foresee and analyze with any particularity the incremental natural gas production that may be induced by permitting exports of LNG to non-FTA countries—whether from unconventional shale gas formations or otherwise. For this reason, and because DOE/FE had received comments regarding the potential environmental impacts associated with unconventional production, DOE/FE produced the Addendum and made it available for public comment. The Addendum takes a broad look at unconventional natural gas production in the United States, with chapters covering water resources (including water quantity and quality), air quality, GHG emissions, induced seismicity, and land use.

The Addendum addresses unconventional natural gas production in the nation as a whole. It does not attempt to identify or characterize the incremental environmental impacts that would result from LNG exports to non-FTA nations. Such impacts are not reasonably foreseeable and cannot be analyzed with any particularity. To begin, there is uncertainty as to the aggregate quantity of natural gas that ultimately may be exported to non-FTA countries. Receiving a non-FTA authorization from DOE/FE does not guarantee that a particular facility would be financed and built; nor does it guarantee that, if built, market conditions would continue to favor export once the facility is operational. To illustrate the point, of the more than 40 applications to build

\textsuperscript{326} Id. at P 115-116.

\textsuperscript{327} Under CEQ’s regulations, “indirect effects” of a proposed action are “caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable.” 40 C.F.R. § 1508.8(b).
new LNG import facilities that were submitted to federal agencies between 2000 and 2010, only eight new facilities were built and those facilities have seen declining use in the past decade.328

There is also fundamental uncertainty as to where any additional production would occur and in what quantity. As the Addendum illustrates, nearly all of the environmental issues presented by unconventional natural gas production are local in nature, affecting local water resources, local air quality, and local land use patterns, all under the auspices of state and local regulatory authority. As DOE explained in Sabine Pass, Order No. 2961-A, without knowing where, in what quantity, and under what circumstances additional gas production will arise, the environmental impacts resulting from production activity induced by LNG exports to non-FTA countries are not “reasonably foreseeable” within the meaning of the CEQ’s NEPA regulations.329

3. **Cumulative Environmental Impacts**

Sierra Club has asserted in this proceeding that our environmental review must consider the cumulative environmental impacts from all proposed and previously approved export authorizations and that a programmatic EIS is legally required for these purposes. The cumulative environmental impact analysis in the FERC Order examined cumulative impacts from other projects in the vicinity of the proposed Liquefaction Project that affect the same resources in the same approximate time frame.330 FERC agreed with the conclusion in the final EIS that,

---

330 See FERC Order at PP 102-06.
based in part on the implementation of Magnolia LNG’s environmental mitigation measures, “cumulative impacts on roadway and marine traffic will be moderate.”

We find that the environmental review conducted by FERC took into account all reasonably foreseeable cumulative environmental impacts relating to the exports of LNG proposed in this proceeding. In our view, Sierra Club is seeking a programmatic EIS when there was no “program” before FERC that met the definition under CEQ guidelines. Thus, the EIS properly fulfilled its purpose of disclosing the environmental impacts of the Liquefaction Project while also setting forth measures that would mitigate or minimize potential impacts. We, therefore, agree with FERC’s reasoning and adopt its analysis concerning cumulative environmental impacts.

4. Environmental Impacts Associated with Induced Production of Natural Gas

The current rapid development of natural gas resources in the United States likely will continue, with or without the export of natural gas to non-FTA nations. Nevertheless, a decision by DOE/FE to authorize exports to non-FTA nations could accelerate that development by some increment. For this reason, DOE/FE prepared and received public comment on the Addendum and made the Addendum and the comments part of the record in this proceeding. As discussed above, the Addendum reviewed the academic and technical literature covering the most significant issues associated with unconventional gas production, including impacts to water resources, air quality, greenhouse gas emissions, induced seismicity, and land use.

The Addendum shows that there are potential environmental issues associated with unconventional natural gas production that need to be carefully managed, especially with respect

331 Id. at P 106.
332 40 C.F.R. §§ 1508.7, 1508.8.
333 Addendum at 2.
to emissions of VOCs and methane, and the potential for groundwater contamination. These environmental concerns do not lead us to conclude, however, that exports of natural gas to non-FTA nations should be prohibited. Rather, we believe the public interest is better served by addressing these environmental concerns directly—through federal, state, or local regulation, or through self-imposed industry guidelines where appropriate—rather than by prohibiting exports of natural gas. Unlike DOE, environmental regulators have the legal authority to impose requirements on natural gas production that appropriately balance benefits and burdens, and to update these regulations from time to time as technological practices and scientific understanding evolve. For example, in 2012, using its authority under the Clean Air Act, EPA promulgated regulations for hydraulically fractured wells that are expected to yield significant emissions reductions.334 In 2013, EPA updated those regulations to include storage tanks,335 and in 2014 EPA issued a series of technical white papers exploring the potential need for additional measures to address methane emissions from the oil and gas sector.336 In January 2015, EPA announced a strategy for “address[ing] methane and smog-forming VOC emissions from the oil and gas industry in order to ensure continued, safe and responsible growth in U.S. oil and natural gas production.”337 Specifically, as part of the Administration’s efforts to address climate change, EPA has initiated a rulemaking to set standards for methane and VOC emissions from new and modified oil and gas production sources, and natural gas processing and transmission

Section 3(a) of the NGA is too blunt an instrument to address these environmental concerns efficiently. A decision to prohibit exports of natural gas would cause the United States to forego entirely the economic and international benefits discussed herein, but would have little more than a modest, incremental impact on the environmental issues identified by intervenors. For these reasons, we conclude that the environmental concerns associated with natural gas production do not establish that exports of natural gas to non-FTA nations are inconsistent with the public interest.

5. Compliance with the Endangered Species Act

To comply with the Endangered Species Act (ESA), the final EIS adopted by FERC reflected input gathered from the U.S. Fish and Wildlife Service and the National Marine Fisheries Service regarding the biological impacts of the Liquefaction Project on animal species within the parishes or counties affected by the Project. The final EIS concluded that the Magnolia LNG and Kinder Morgan Louisiana Projects will have no effect on four federally listed species in parishes affected by the projects, and are not likely to adversely affect 11 other federally listed species found in those parishes. Additionally, the EIS concluded that the Projects

338 The White House, Office of the Press Secretary, Fact Sheet: Administration Takes Steps Forward on Climate Action Plan by Announcing Actions to Cut Methane Emissions (Jan. 14, 2015), available at https://www.whitehouse.gov/the-press-office/2015/01/14/fact-sheet-administration-takes-steps-forward-climate-action-plan-anno-1 (stating that, in developing the proposed and final standards, EPA “will focus on in-use technologies, current industry practices, [and] emerging innovations … to ensure that emissions reductions can be achieved as oil and gas production and operations continue to grow.”).

340 See supra note 241.
are not likely to destroy or adversely modify designated critical habitat, and would not contribute to the trend toward federal listing for one candidate species.\textsuperscript{341}

Sierra Club argues in the current proceeding that DOE/FE must conduct a broader inquiry than that conducted by FERC in order to comply with ESA. Specifically, it contends that “DOE/FE must consider not just species impacts at the proposed project site (although it must do that), but the effects of increased gas production across the full region the terminal affects.”\textsuperscript{342} These arguments echo those that it makes in support of a broader scope for NEPA review, \textit{i.e.} the proposal to export LNG, if granted, will impact a wide area due to induced natural gas production activities. DOE need not repeat its arguments with respect to the appropriate scope of review over indirect effects except to observe that conducting a wider regional or national consultation regarding species impacts would add greatly to the burden of acting on applications to export natural gas to non-FTA countries. Moreover, the inability to predict at a local level the volumes of induced natural gas production would make such ESA analysis more speculative than informative. The scope of review undertaken by FERC in the EIS was properly limited to reasonably foreseeable impacts of the proposed Liquefaction Project and its use for the export of LNG. Accordingly, we reject Sierra Club’s arguments in respect to the scope of ESA review.

Sierra Club and other commenters on the LCA GHG Report, the Addendum, and the 2014 and 2015 LNG Export Studies have expressed concern that exports of domestic natural gas to non-FTA nations may impact the balance of global GHG emissions through their impact domestically on the price and availability of natural gas for electric generation and other uses.

\textsuperscript{341} Final EIS at ES-8; \textit{see also id.} at 5-13.

\textsuperscript{342} Sierra Club Mot. at 10.
They also have objected that exports of natural gas could have a negative effect on the GHG intensity and total amount of energy consumed in foreign nations.

**a. Domestic Environmental Impacts Associated with Increased Natural Gas Prices**

To the extent exports of natural gas to non-FTA nations increase domestic natural gas prices, those higher prices would be expected, all else equal, to reduce the use of natural gas in the United States as compared to a future case in which exports to non-FTA exports were prohibited. Within the U.S. electric generation sector, reduced demand for natural gas caused by higher prices would be balanced by some combination of reduced electric generation overall (aided by conservation and efficiency measures), increased generation from other resources (such as coal, renewables, and nuclear), and more efficient use of natural gas (*i.e.*, shifting of generation to natural gas-fired generators with superior heat rates).

Although EIA’s 2012 Study found that additional natural gas production would supply most of the natural gas needed to support added LNG exports, EIA modeled the effects of higher natural gas prices on energy consumption in the United States in the years 2015 through 2035, and found several additional results. In particular, EIA found that “under Reference case conditions, decreased natural gas consumption as a result of added exports are countered proportionately by increased coal consumption (72 percent), increased liquid fuel consumption (8 percent), other increased consumption, such as from renewable generation sources (9 percent), and decreases in total consumption (11 percent).”343 Further, EIA determined that, in the earlier years of the 2015 to 2035 period, “the amount of natural gas to coal switching is greater,” with “coal play[ing] a more dominant role in replacing the decreased levels of natural gas

343 2012 EIA Study at 18.
consumption, which also tend to be greater in the earlier years.”\textsuperscript{344} Likewise, “[s]witching from natural gas to coal is less significant in later years, partially as a result of a greater proportion of switching into renewable generation.”\textsuperscript{345} EIA ultimately projected that, for LNG export levels from 6 to 12 Bcf/d of natural gas and under Reference case conditions, aggregate carbon dioxide emissions would increase above a base case with no exports by between 643 and 1,227 million metric tons (0.5 to 1.0 percent) over the period from 2015 to 2035.\textsuperscript{346} It is worth noting, however, that a substantial portion of these projected emissions came from consumption of natural gas in the liquefaction process, rather than from increased use of coal. The liquefaction of natural gas is captured in the LCA GHG Report’s estimate of the life cycle GHG emissions of U.S.-exported LNG, discussed above.

We further note that EIA’s 2014 Study assumed the regulations in effect at the time the AEO 2014 was prepared.\textsuperscript{347} Therefore, EIA’s analysis included the impacts that EPA’s Mercury and Air Toxics Standard\textsuperscript{348} but not EPA’s Transport Rule\textsuperscript{349} as it had been vacated at the time. EIA’s analysis in 2014 also captured the Clean Air Interstate Rule, which sets limits on regional sulfur dioxide and mono-nitrogen oxides (SO\textsubscript{2} and NO\textsubscript{x}). There are, however, other rules that were not final at the time of AEO 2014, including two then-proposed rules from EPA to reduce the extent to which the increased use of coal would compensate for reduced use of natural gas. These rules, finalized in the fall of 2015, impose limits on GHG emissions from both new and

\begin{footnotesize}
\begin{itemize}
\item\textsuperscript{344} Id.
\item\textsuperscript{345} Id.
\item\textsuperscript{346} Id. at 19.
\item\textsuperscript{347} See supra § VII.B.
\end{itemize}
\end{footnotesize}
existing coal-fired power plants. In particular, these rules have the potential to mitigate significantly any increased emissions from the U.S. electric power sector that would otherwise result from increased use of coal, and perhaps to negate those increased emissions entirely.

The AEO 2016 incorporated the Clean Power Plan final rule in the Reference case and assumes that all states choose to meet a mass-based standard to cover both existing and new sources of carbon dioxide emissions. In the Reference case—which includes 18.4 Bcf/d of LNG exports from the United States in 2040—electric power sector carbon dioxide emissions are projected to be 35 percent below 2005 levels in 2030 due to the implementation of the CPP. Natural gas generation increases by 44 percent in the Reference case from 2015 to 2040, and coal generation declines by 32 percent from 2015 to 2040.

Therefore, on the record before us, we cannot conclude that exports of natural gas would be likely to cause a significant increase in U.S. GHG emissions through their effect on natural gas prices and the use of coal for electric generation.

b. **International Impacts Associated with Energy Consumption in Foreign Nations**

The LCA GHG Report estimated the life cycle GHG emissions of U.S. LNG exports to Europe and Asia, compared with certain other fuels used to produce electric power in those importing countries. The key findings for U.S. LNG exports to Europe and Asia are summarized in Figures 3 and 4 below, which are also presented above in Section IX.A (Figures 1 and 2):

---

Figure 3: Life Cycle GHG Emissions for Natural Gas and Coal Power in Europe\textsuperscript{351}

\begin{figure}
\centering
\includegraphics[width=\textwidth]{life_cycle_emissions.png}
\caption{Life Cycle GHG Emissions for Natural Gas and Coal Power in Europe\textsuperscript{351}}
\end{figure}

\textsuperscript{351} LCA GHG Report at 9 (Figure 6-1).
While acknowledging substantial uncertainty, the LCA GHG Report shows that to the extent U.S. LNG exports are preferred over coal in LNG-importing nations, U.S. LNG exports are likely to reduce global GHG emissions. Further, to the extent U.S. LNG exports are preferred over other forms of imported natural gas, they are likely to have only a small impact on global GHG emissions.353

The LCA GHG Report does not answer the ultimate question whether authorizing exports of natural gas to non-FTA nations will increase or decrease global GHG emissions, because regional coal and imported natural gas are not the only fuels with which U.S.-exported LNG would compete. U.S. LNG exports may also compete with renewable energy, nuclear energy, petroleum-based liquid fuels, coal imported from outside East Asia or Western Europe,

---

352 LCA GHG Report at 10 (Figure 6-2).
353 Id. at 9, 18.
indigenous natural gas, synthetic natural gas derived from coal, and other resources, as well as efficiency and conservation measures. To model the effect that U.S. LNG exports would have on net global GHG emissions would require projections of how each of these fuel sources would be affected in each LNG-importing nation. Such an analysis would not only have to consider market dynamics in each of these countries over the coming decades, but also the interventions of numerous foreign governments in those markets.

For example, Sierra Club and other commenters have observed that renewable energy has experienced significant growth in key LNG-importing countries such as India and China. These commenters do not, however, place the growth of renewable energy in the context of the aggregate use of fossil energy projects in those countries. Nor do they explain the extent to which growth in renewable energy has been driven by public policies in those countries and how the availability of U.S. LNG exports would or would not impact the continuation of those policies.

The uncertainty associated with estimating each of these factors would likely render such an analysis too speculative to inform the public interest determination in this or other non-FTA LNG export proceedings. Accordingly, DOE/FE elected to focus on the discrete question of how U.S. LNG compares on a life cycle basis to regional coal and other sources of imported natural gas in key LNG-importing countries. This is a useful comparison because coal and imported natural gas are prevalent fuel sources for electric generation in non-FTA LNG-importing nations. For example, EIA notes that installed electric generation capacity in China was 63 percent coal and 4 percent natural gas in 2013.\footnote{U.S. Energy Information Administration, China Analysis Brief (last updated May 14, 2015), available at: http://www.eia.gov/beta/international/analysis.cfm?iso=CHN.} For India, installed electric generation capacity in 2014 is

\footnote{U.S. Energy Information Administration, China Analysis Brief (last updated May 14, 2015), available at: http://www.eia.gov/beta/international/analysis.cfm?iso=CHN.}
62 percent coal and 8 percent natural gas. In both China and India, electric generation capacity is expected to increase substantially in coming years. For Japan, the largest importer of LNG in the world, electric generation from fossil fuels was 74 percent of total generation in 2011 and 86 percent in 2013 after the Fukushima disaster. In Europe, use of fossil fuels is slightly less than in the Asian nations noted above but still significant, comprising 62 percent of electric generation in the United Kingdom and around half for Spain for 2014, respectively.

The conclusions of the LCA GHG Report, combined with the observation that many LNG-importing nations rely heavily on fossil fuels for electric generation, suggests that exports of U.S. LNG may decrease global GHG emissions, although there is substantial uncertainty on this point as indicated above. In any event, the record does not support the conclusion that U.S. LNG exports will increase global GHG emissions in a material or predictable way. Therefore, while we share the commenters’ strong concern about GHG emissions as a general matter, based on the current record evidence, we do not see a reason to conclude that U.S. LNG exports will significantly exacerbate global GHG emissions.

7. Other Considerations

Our decision is not premised on an uncritical acceptance of the general conclusion of the 2014 and 2015 LNG Export Studies of net economic benefits from LNG exports. Both of those Studies and many public comments identify significant uncertainties and even potential negative impacts from LNG exports. The economic impacts of higher natural gas prices and potential

---

357 EIA, International Energy Statistics, available at: http://www.eia.gov/beta/international/. To evaluate the effect that U.S. LNG exports may have on the mix of fuels used for electric generation in Western Europe also requires consideration of the role of the European Trading System (ETS). The ETS places a cap on GHG emissions. Therefore, where the cap is a binding constraint, the ETS ultimately may ensure that the availability of U.S.-exported LNG will not affect aggregate emissions.
increases in natural gas price volatility are two of the factors that we view most seriously. Yet we also have taken into account factors that could mitigate such impacts, such as the current oversupply situation and data indicating that the natural gas industry would increase natural gas supply in response to increasing exports. Further, we note that it is far from certain that all or even most of the proposed LNG export projects will ever be realized because of the time, difficulty, and expense of commercializing, financing, and constructing LNG export terminals, as well as the uncertainties inherent in the global market demand for LNG. On balance, we find that the potential negative impacts of Magnolia LNG’s proposed exports are outweighed by the likely net economic benefits and by other non-economic or indirect benefits.

More generally, DOE/FE continues to subscribe to the principle set forth in our 1984 Policy Guidelines that, under most circumstances, the market is the most efficient means of allocating natural gas supplies. However, agency intervention may be necessary to protect the public in the event there is insufficient domestic natural gas for domestic use. There may be other circumstances as well that cannot be foreseen that would require agency action. Given these possibilities, DOE/FE recognizes the need to monitor market developments closely as the impact of successive authorizations of LNG exports unfolds.

359 Some commenters previously asked DOE to clarify the circumstances under which the agency would exercise its authority to revoke (in whole or in part) previously issued LNG export authorizations. We cannot precisely identify all the circumstances under which such action would be taken. We reiterate our observation in Sabine Pass that: “In the event of any unforeseen developments of such significant consequence as to put the public interest at risk, DOE/FE is fully authorized to take action as necessary to protect the public interest. Specifically, DOE/FE is authorized by section 3(a) of the Natural Gas Act … to make a supplemental order as necessary or appropriate to protect the public interest. Additionally, DOE is authorized by section 16 of the Natural Gas Act ‘to perform any and all acts and to prescribe, issue, make, amend, and rescind such orders, rules, and regulations as it may find necessary or appropriate’ to carry out its responsibilities.” Sabine Pass, DOE/FE Order No. 2961, at 33 n.45 (quoting 15 U.S.C. § 717o).
D. Conclusion

We have reviewed the evidence in the record and relevant precedent in earlier non-FTA export decisions and have not found an adequate basis to conclude that Magnolia LNG’s proposed exports of LNG to non-FTA countries will be inconsistent with the public interest. We further find that the two intervenor-protestors in this proceeding—Sierra Club and APGA—have failed to overcome the statutory presumption that the proposed export authorization is consistent with the public interest. For these reasons, we are authorizing Magnolia LNG’s proposed exports to non-FTA countries subject to the limitations and conditions described in this Order.

In deciding whether to grant a final non-FTA export authorization, we consider in our decision-making the cumulative impacts of the total volume of all final non-FTA export authorizations. With the issuance of this Order, DOE/FE has now issued final non-FTA authorizations in a cumulative volume of exports totaling 16.30 Bcf/d of natural gas, or 5.95 trillion cubic feet per year, for the 22 final authorizations issued to date—Sabine Pass Liquefaction, LLC (2.2 Bcf/d), Carib Energy (USA) LLC (0.04 Bcf/d), Cameron LNG, LLC (1.7 Bcf/d), FLEX I (1.4 Bcf/d), FLEX II (0.4 Bcf/d), Dominion Cove Point LNG, 

---

361 *Carib Energy (USA) LLC*, DOE/FE Order No. 3487, FE Docket No. 11-141-LNG, Final Order Granting Long-Term, Multi-Contract Authorization to Export Liquefied Natural Gas in ISO Containers by Vessel to Non-Free Trade Agreement Nations in Central America, South America, or the Caribbean (Sept. 10, 2014).

LP (0.77 Bcf/d), Cheniere Marketing, LLC and Corpus Christi Liquefaction, LLC (2.1 Bcf/d), Sabine Pass Liquefaction, LLC Expansion Project (1.38 Bcf/d), American Marketing LLC (0.008 Bcf/d), Emera CNG, LLC (0.008 Bcf/d), Floridian Natural Gas Storage Company, LLC, Air Flow North American Corp. (0.002 Bcf/d), Bear Head LNG Corporation and Bear Head LNG (USA), LLC (0.81 Bcf/d), Pieridae Energy (USA) Ltd., Sabine Pass Liquefaction, LLC Design Increase (0.56 Bcf/d), Cameron LNG, LLC Design Increase (0.56 Bcf/d).

365 Dominion Cove Point LNG, LP, DOE/FE Order No. 3331-A, FE Docket No. 11-128-LNG, Final Opinion and Order Granting Long-Term, Multi-Contract Authorization to Export Liquefied Natural Gas from the Cove Point LNG Terminal in Calvert County, Maryland, to Non-Free Trade Agreement Nations (May 7, 2015).
372 Bear Head LNG Corporation and Bear Head LNG (USA), DOE/FE Order No. 3770, FE Docket No. 15-33-LNG, Final Opinion and Order Granting Long-Term, Multi-Contract Authorization to Export U.S.-Sourced Natural Gas by Pipeline to Canada for Liquefaction and Re-Export in the Form of Liquefied Natural Gas to Non-Free Trade Agreement Countries (Feb. 5, 2016).
Increase (0.42 Bcf/d), Flint Hills Resources, LP (0.01 Bcf/d), Cameron LNG, LLC Expansion Project (1.41 Bcf/d), Lake Charles Exports, LLC (2.0 Bcf/d), Lake Charles LNG Export Company, LLC, Carib Energy (USA) LLC (0.004 Bcf/d), and this Order.

We note that the volumes authorized for export in the Lake Charles Exports, LLC and Lake Charles LNG Export Co., LLC orders are both 730 Bcf/yr (2.0 Bcf/d), yet are not additive to one another because the source of LNG approved under both orders is from the Lake Charles Terminal. Likewise, the volumes authorized for export in the Carib (2014) and Floridian orders are both 14.6 Bcf/yr of natural gas (0.04 Bcf/d), yet are not additive to one another because the source of LNG approved under both orders is from the Floridian Facility. Additionally, the volumes authorized for export in the Bear Head and Pieridae US orders are not additive; together, they are limited to a maximum of 0.81 Bcf/d to reflect the current capacity of the

380 Carib Energy (USA) LLC, DOE/FE Order No. 3937, Opinion and Order Granting Long-Term, Multi-Contract Authorization to Export Liquefied Natural Gas in ISO Containers Loaded at Designated Pivotal LNG, Inc. Facilities and Exported by Vessel to Non-Free Trade Agreement Nations in Central America, South America, or the Caribbean.
381 See Floridian Natural Gas Storage Co., LLC, DOE/FE Order No. 3744, at 22 (stating that the quantity of LNG authorized for export by Floridian in DOE/FE Order No. 3744 “will be reduced by the portion of the total approved volume of 14.6 Bcf/yr that is under firm contract directly or indirectly to Carib Energy (USA), LLC”); see also id. at 21 (Floridian “may not treat the volumes authorized for export in the [Carib and Floridian] proceedings as additive to one another”).
Maritimes Northeast Pipeline at the U.S.-Canadian border. In sum, the total export volume is within the range of scenarios analyzed in the 2014 and 2015 LNG Export Studies. The 2015 Study found that in all such scenarios—assuming LNG export volumes totaling 12 Bcf/d up to 20 Bcf/d of natural gas—the United States would experience net economic benefits.

DOE/FE will continue taking a measured approach in reviewing the other pending applications to export domestically produced LNG. Specifically, DOE/FE will continue to assess the cumulative impacts of each succeeding request for export authorization on the public interest with due regard to the effect on domestic natural gas supply and demand fundamentals. In keeping with the performance of its statutory responsibilities, DOE/FE will attach appropriate and necessary terms and conditions to authorizations to ensure that the authorizations are utilized in a timely manner and that authorizations are not issued except where the applicant can show that there are or will be facilities capable of handling the proposed export volumes and existing and forecast supplies that support that action. Other conditions will be applied as necessary.

The reasons in support of proceeding cautiously are several: (1) the 2014 and 2015 LNG Export Studies, like any studies based on assumptions and economic projections, are inherently limited in their predictive accuracy; (2) applications to export significant quantities of domestically produced LNG are a new phenomena with uncertain impacts; and (3) the market for natural gas has experienced rapid reversals in the past and is again changing rapidly due to economic, technological, and regulatory developments. The market of the future very likely will not resemble the market of today. In recognition of these factors, DOE/FE intends to monitor developments that could tend to undermine the public interest in grants of successive

---

382 See Bear Head LNG Corporation and Bear Head LNG (USA), DOE/FE Order No. 3770, at 178-79 (stating that the quantity of LNG authorized for export by Bear Head LNG and Pieridae US “are not additive; together, they are limited to a maximum of 0.81 Bcf/d to reflect the current capacity of the M&N US Pipeline”).
applications for exports of domestically produced LNG and, as previously stated, to attach terms and conditions to the authorization in this proceeding and to succeeding LNG export authorizations as are necessary for protection of the public interest.

XIII. TERMS AND CONDITIONS

To ensure that the authorization issued by this Order is not inconsistent with the public interest, DOE/FE has attached the following Terms and Conditions to the authorization. The reasons for each term or condition are explained below. Magnolia LNG must abide by each Term and Condition or may face rescission of the authorization or other appropriate sanction.

A. Term of the Authorization

Magnolia LNG requests a 25-year term for the authorization commencing from the date export operations begin. However, consistent with our prior non-FTA authorizations to date, we believe that caution recommends limiting this authorization to no longer than a 20-year term beginning from the date of first export. In imposing this condition, we are mindful that LNG export facilities are capital intensive and that, to obtain financing for such projects, there must be a reasonable expectation that the authorization will continue for a term sufficient to support repayment. We find that a 20-year term is likely sufficient to achieve this result. Accordingly, the 20-year term will begin on the data when Magnolia LNG commences commercial export of domestically sourced LNG from the Magnolia LNG Terminal, but not before.

B. Commencement of Operations Within Seven Years

Magnolia LNG requests this authorization to commence on the earlier of the date of first export or 10 years from the date of issuance of this Order. However, consistent with our prior non-FTA authorizations to date, DOE/FE will add as a condition of the authorization that Magnolia LNG must commence commercial LNG export operations from the Liquefaction Project no later than seven years from the date of issuance of this Order. The purpose of this
condition is to ensure that other entities that may seek similar authorizations are not frustrated in their efforts to obtain those authorizations by authorization holders that are not engaged in actual export operations.

C. Commissioning Volumes

Magnolia LNG will be permitted to apply for short-term export authorizations to export Commissioning Volumes prior to the commencement of the first commercial exports of domestically sourced LNG from the Magnolia LNG Terminal. “Commissioning Volumes” are defined as the volume of LNG produced and exported under a short-term authorization during the initial start-up of each LNG train, before each LNG train has reached its full steady-state capacity and begun its commercial exports pursuant to Magnolia LNG’s long-term contracts.383 The Commissioning Volumes will not be counted against the maximum level of volumes previously authorized in Magnolia LNG’s FTA authorizations (DOE/FE Order Nos. 3245 and 3406) or in this Order.

D. Make-Up Period

Magnolia LNG will be permitted to continue exporting for a total of three years following the end of the 20-year term established in this Order, solely to export any Make-Up Volume that it was unable to export during the original export period. The three-year term during which the Make-Up Volume may be exported shall be known as the “Make-Up Period.”

The Make-Up Period does not affect or modify the total volume of LNG previously authorized in Magnolia LNG’s FTA authorizations (DOE/FE Order Nos. 3245 and 3406) or in

this Order. Insofar as Magnolia LNG may seek to export additional volumes not previously authorized for export, it will be required to obtain appropriate authorization from DOE/FE.

**E. Transfer, Assignment, or Change in Control**

DOE/FE’s natural gas import/export regulations prohibit authorization holders from transferring or assigning authorizations to import or export natural gas without specific authorization by the Assistant Secretary for Fossil Energy.\(^{384}\) As a condition of the similar authorization issued to Sabine Pass in DOE/FE Order No. 2961, DOE/FE found that the requirement for prior approval by the Assistant Secretary under its regulations applies to any change of effective control of the authorization holder either through asset sale or stock transfer or by other means. This condition was deemed necessary to ensure that, prior to any transfer or change in control, DOE/FE will be given an adequate opportunity to assess the public interest impacts of such a transfer or change.

DOE/FE construes a change in control to mean a change, directly or indirectly, of the power to direct the management or policies of an entity whether such power is exercised through one or more intermediary companies or pursuant to an agreement, written or oral, and whether such power is established through ownership or voting of securities, or common directors, officers, or stockholders, or voting trusts, holding trusts, or debt holdings, or contract, or any other direct or indirect means. A rebuttable presumption that control exists will arise from the ownership or the power to vote, directly or indirectly, 10 percent or more of the voting securities of such entity.\(^{385}\)

\(^{384}\) 10 C.F.R. § 590.405.

\(^{385}\) For information on DOE/FE’s procedures governing a change in control, see U.S. Dep’t of Energy, Procedures for Changes in Control Affecting Applications and Authorizations to Import or Export Natural Gas, 79 Fed. Reg. 65,641 (Nov. 5, 2014) [hereinafter Procedures for Changes in Control].
F. Agency Rights

Magnolia LNG requests authorization to export LNG from the Project in a volume equivalent to 394.2 Bcf/yr on its own behalf and as agent for other entities that hold title to the LNG at the time of export, pursuant to long-term contracts. DOE/FE previously addressed the issue of Agency Rights in Order No. 2913, which granted Freeport LNG Expansion, L.P., et al. (FLEX) authority to export LNG to FTA countries. In that order, DOE/FE approved a proposal by FLEX to register each LNG title holder for whom FLEX sought to export LNG as agent. DOE/FE found that this proposal was an acceptable alternative to the non-binding policy adopted by DOE/FE in Dow Chemical, which established that the title for all LNG authorized for export must be held by the authorization holder at the point of export. We find that the same policy considerations that supported DOE/FE’s acceptance of the alternative registration proposal in Order No. 2913 apply here as well.

DOE/FE has reiterated its policy on Agency Rights procedures in prior authorizations, including in Cameron LNG, LLC, DOE/FE Order No. 3846. In that order, DOE/FE determined that, in LNG export orders in which Agency Rights have been granted, DOE/FE shall require registration materials filed for, or by, an LNG title-holder (Registrant) to include the same company identification information and long-term contract information of the Registrant as if the Registrant had filed an application to export LNG on its own behalf.

To ensure that the public interest is served, the authorization granted herein shall be conditioned to require that where Magnolia LNG proposes to export LNG from Magnolia LNG

388 See Cameron LNG, LLC, DOE/FE Order No. 3846.
389 See id. at 128-29 (citation omitted).
Terminal as agent for other entities that hold title to the LNG (Registrants), it must register with DOE/FE those entities on whose behalf it will export LNG in accordance with the procedures and requirements described herein.

G. Contract Provisions for the Sale or Transfer of LNG to be Exported

DOE/FE’s regulations require applicants to supply transaction-specific factual information “to the extent practicable.”390 Additionally, DOE/FE regulations allow confidential treatment of the information supplied in support of or in opposition to an application if the submitting party requests such treatment, shows why the information should be exempted from public disclosure, and DOE/FE determines it will be afforded confidential treatment in accordance with 10 C.F.R. § 1004.11.391

DOE/FE will require that Magnolia LNG file or cause to be filed with DOE/FE any relevant long-term commercial agreements, including liquefaction tolling agreements, pursuant to which Magnolia LNG exports LNG as agent for a Registrant.

DOE/FE finds that the submission of all such agreements or contracts within 30 days of their execution using the procedures described below will be consistent with the “to the extent practicable” requirement of section 590.202(b). By way of example and without limitation, a “relevant long-term commercial agreement” would include an agreement with a minimum term of two years, an agreement to provide natural gas processing or liquefaction services at the Magnolia LNG Terminal, a long-term sales contract involving natural gas or LNG stored or liquefied at the Terminal, or an agreement to provide export services from the Terminal.

390 10 C.F.R. § 590.202(b).
391 Id. § 590.202(e).
In addition, DOE/FE finds that section 590.202(c) of DOE/FE’s regulations\(^{392}\) requires that Magnolia LNG file, or cause to be filed, all long-term contracts associated with the long-term supply of natural gas to the Magnolia LNG Terminal, whether signed by Magnolia LNG or the Registrant, within 30 days of their execution.

DOE/FE recognizes that some information in Magnolia LNG’s or a Registrant’s long-term commercial agreements associated with the export of LNG, and/or long-term contracts associated with the long-term supply of natural gas to the Magnolia LNG Terminal, may be commercially sensitive. DOE/FE therefore will provide Magnolia LNG the option to file or cause to be filed either unredacted contracts, or in the alternative (A) Magnolia LNG may file, or cause to be filed, long-term contracts under seal, but it also will file either: i) a copy of each long-term contract with commercially sensitive information redacted, or ii) a summary of all major provisions of the contract(s) including, but not limited to, the parties to each contract, contract term, quantity, any take or pay or equivalent provisions/conditions, destinations, re-sale provisions, and other relevant provisions; and (B) the filing must demonstrate why the redacted information should be exempted from public disclosure.

To ensure that DOE/FE destination and reporting requirements included in this Order are conveyed to subsequent title holders, DOE/FE will include as a condition of this authorization that future contracts for the sale or transfer of LNG exported pursuant to this Order shall include an acknowledgement of these requirements.

**H. Export Quantity**

Magnolia LNG sought authorization to export up 394.2 Bcf/yr of natural gas (1.08 Bcf/d), which is within the maximum liquefaction capacity of the Liquefaction Project as

\(^{392}\) Id. § 590.202(c).
approved by FERC. As set forth herein, this Order authorizes the export of LNG in the full amount requested, up to the equivalent of 394.2 Bcf/yr of natural gas.

I. Combined FTA and Non-FTA Export Authorization Volumes

Magnolia LNG is currently authorized in DOE/FE Order Nos. 3245 and 3406 to export domestically produced LNG to FTA countries in a combined total volume identical to the volume authorized in this Order, equivalent to approximately 394.2 Bcf/yr of natural gas. Because the source of LNG for those FTA orders and this Order is the Magnolia LNG Project, Magnolia LNG may not treat the volumes authorized for export in these proceedings as additive to one another.

XIV. FINDINGS

On the basis of the findings and conclusions set forth above, we find that it has not been shown that a grant of the requested authorization will be inconsistent with the public interest, and we further find that Magnolia LNG’s Application should be granted subject to the Terms and Conditions set forth herein. The following Ordering Paragraphs reflect current DOE/FE practice.

XV. ORDER

Pursuant to section 3 of the Natural Gas Act, it is ordered that:

A. Magnolia LNG, LLC is authorized to export domestically produced LNG by vessel from the proposed Magnolia LNG Terminal to be located near Lake Charles, Louisiana, in Calcasieu Parish, in a volume equivalent to 394.2 Bcf/yr of natural gas. Magnolia LNG is authorized to export this LNG on its own behalf and as agent for other entities that hold title to the natural gas, pursuant to one or more long-term contracts (a contract greater than two years).

B. The 20-year authorization period will commence when Magnolia LNG commences commercial export of domestically sourced LNG from the Magnolia Terminal, but not before. Magnolia LNG may export Commissioning Volumes prior to the commencement of the terms of
this Order, pursuant to a separate short-term export authorization. The Commissioning Volumes will not be counted against the maximum level of volumes previously authorized in Magnolia LNG’s FTA orders (DOE/FE Order Nos. 3245 and 3406) or in this Order.

C. Magnolia LNG may continue exporting for a total of three years following the end of the 20-year export term, solely to export any Make-Up Volume that it was unable to export during the original export period. The three-year Make-Up Period allowing the export of Make-Up Volumes does not affect or modify the maximum volume of LNG authorized for export in Magnolia’s existing FTA orders (DOE/FE Order Nos. 3245 and 3406) or in this Order. Insofar as Magnolia LNG may seek to export additional volumes not previously authorized for export, it will be required to obtain appropriate authorization from DOE/FE.

D. Magnolia LNG must commence export operations using the planned liquefaction facilities no later than seven years from the date of issuance of this Order.

E. The LNG export quantity authorized in this Order is equivalent to 394.2 Bcf/yr of natural gas. This quantity is not additive to the export volume in either of Magnolia LNG’s existing FTA authorizations, set forth in DOE/FE Order Nos. 3245 and 3406.

F. This LNG may be exported to any country with which the United States does not have a FTA requiring the national treatment for trade in natural gas, which currently has or in the future develops the capacity to import LNG, and with which trade is not prohibited by United States law or policy.

G. Magnolia LNG shall ensure that all transactions authorized by this Order are permitted and lawful under United States laws and policies, including the rules, regulations, orders, policies, and other determinations of the Office of Foreign Assets Control of the United
States Department of the Treasury and FERC. Failure to comply with this requirement could result in rescission of this authorization and/or other civil or criminal remedies.

H. Magnolia LNG shall ensure compliance with all terms and conditions established by FERC in the EIS, including the 115 conditions adopted in the FERC Order (the 114 conditions recommended in the EIS and the additional condition added by FERC). Additionally, this authorization is conditioned on Magnolia LNG’s on-going compliance with any other preventative and mitigative measures at the Magnolia LNG Terminal imposed by federal or state agencies.

I. (i) Magnolia LNG shall file, or cause others to file, with the Office of Regulation and International Engagement a non-redacted copy of all executed long-term contracts associated with the long-term export of LNG as agent for other entities from the Magnolia LNG Terminal. The non-redacted copies may be filed under seal and must be filed within 30 days of their execution. Additionally, if Magnolia LNG has filed the contracts described in the preceding sentence under seal or subject to a claim of confidentiality or privilege, within 30 days of their execution, Magnolia LNG shall also file, or cause others to file, for public posting either: (a) a redacted version of the contracts described in the preceding sentence, or (b) major provisions of the contracts. In these filings, Magnolia LNG shall state why the redacted or non-disclosed information should be exempted from public disclosure.

(ii) Magnolia LNG shall file, or cause others to file, with the Office of Regulation and International Engagement a non-redacted copy of all executed long-term contracts associated with the long-term supply of natural gas to the Magnolia LNG Terminal. The non-redacted copies may be filed under seal and must be filed within 30 days of their execution. Additionally, if Magnolia LNG has filed the contracts described in the preceding sentence under seal or subject
to a claim of confidentiality or privilege, within 30 days of their execution, Magnolia LNG shall also file, or cause others to file, for public posting either: i) a redacted version of the contracts described in the preceding sentence, or ii) major provisions of the contracts. In these filings, Magnolia LNG shall state why the redacted or non-disclosed information should be exempted from public disclosure.

J. Magnolia LNG, or others for whom Magnolia LNG acts as agent, shall include the following provision in any agreement or other contract for the sale or transfer of LNG exported pursuant to this Order and any other applicable DOE/FE authorization:

Customer or purchaser acknowledges and agrees that it will resell or transfer U.S.-sourced natural gas in the form of LNG purchased hereunder for delivery only to countries identified in Ordering Paragraph F of DOE/FE Order No. 3909, issued November 30, 2016, in FE Docket No. 13-132-LNG and/or to purchasers that have agreed in writing to limit their direct or indirect resale or transfer of such LNG to such countries. Customer or purchaser further commits to cause a report to be provided to Magnolia LNG, LLC that identifies the country of destination (or countries) into which the exported LNG or natural gas was actually delivered and/or received for end use, and to include in any resale contract for such LNG the necessary conditions to insure that Magnolia LNG, LLC is made aware of all such actual destination countries.

K. Magnolia LNG is permitted to use its authorization in order to export LNG as agent for other entities, after registering such entities with DOE/FE. Registration materials shall include an acknowledgement and agreement by the Registrant to supply Magnolia LNG with all information necessary to permit Magnolia LNG to register that person or entity with DOE/FE, including: (1) the Registrant’s agreement to comply with this Order and all applicable requirements of DOE/FE’s regulations at 10 C.F.R. Part 590, including but not limited to destination restrictions; (2) the exact legal name of the Registrant, state/location of incorporation/registration, primary place of doing business, and the Registrant’s ownership structure, including the ultimate parent entity if the Registrant is a subsidiary or affiliate of
another entity; (3) the name, title, mailing address, e-mail address, and telephone number of a corporate officer or employee of the Registrant to whom inquiries may be directed; and (4) within 30 days of execution, a copy of any long-term contracts not previously filed with DOE/FE, described in Ordering Paragraph I of this Order.

L. Each registration submitted pursuant to this Order shall have current information on file with DOE/FE. Any changes in company name, contact information, change in term of the long-term contract, termination of the long-term contract, or other relevant modification, shall be filed with DOE/FE within 30 days of such change(s).

M. As a condition of this authorization, Magnolia LNG shall ensure that all persons required by this Order to register with DOE/FE have done so. Any failure by Magnolia LNG to ensure that all such persons or entities are registered with DOE/FE shall be grounds for rescinding in whole or in part the authorization.

N. Within two weeks after the first export of domestically produced LNG occurs from the Magnolia LNG Terminal, Magnolia LNG shall provide written notification of the date that the first export of LNG authorized in Ordering Paragraph A above occurred.

O. Magnolia LNG shall file with the Office of Regulation and International Engagement, on a semi-annual basis, written reports describing the progress of the Magnolia LNG Project. The reports shall be filed on or by April 1 and October 1 of each year, and shall include information on the progress of the Magnolia LNG Project, the date the Project is expected to be operational, and the status of the long-term contracts associated with the long-term export of LNG and any long-term supply contracts.

P. With respect to any change in control of the authorization holder, Magnolia LNG must comply with DOE/FE’s Procedures for Change in Control Affecting Applications and
Authorizations to Import or Export Natural Gas.\textsuperscript{393} For purposes of this Ordering Paragraph, a “change in control” shall include any change, directly or indirectly, of the power to direct the management or policies of Magnolia LNG, whether such power is exercised through one or more intermediary companies or pursuant to an agreement, written or oral, and whether such power is established through ownership or voting of securities, or common directors, officers, or stockholders, or voting trusts, holding trusts, or debt holdings, or contract, or any other direct or indirect means.\textsuperscript{394}

Q. Monthly Reports: With respect to the LNG exports authorized by this Order, Magnolia LNG shall file with the Office of Regulation and International Engagement, within 30 days following the last day of each calendar month, a report indicating whether exports of LNG have been made. The first monthly report required by this Order is due not later than the 30\textsuperscript{th} day of the month following the month of first export. In subsequent months, if exports have not occurred, a report of “no activity” for that month must be filed. If exports of LNG have occurred, the report must give the following details of each LNG cargo: (1) the name(s) of the authorized exporter registered with DOE/FE; (2) the name of the U.S. export terminal; (3) the name of the LNG tanker; (4) the date of departure from the U.S. export terminal; (5) the country (or countries) into which the exported LNG or natural gas is actually delivered and/or received for end use; (6) the name of the supplier/seller; (7) the volume in Mcf; (8) the price at point of export per million British thermal units (MMBtu); (9) the duration of the supply agreement; and (10) the name(s) of the purchaser(s).

(Approved by the Office of Management and Budget under OMB Control No. 1901-0294)

\textsuperscript{393} See Procedures for Changes in Control at 65,541-42.
\textsuperscript{394} See id. at 65,542.
R. All monthly report filings shall be made to U.S. Department of Energy (FE-34), Office of Fossil Energy, Office of Regulation and International Engagement, P.O. Box 44375, Washington, D.C. 20026-4375, Attention: Natural Gas Reports. Alternatively, reports may be e-mailed to ngreports@hq.doe.gov or may be faxed to Natural Gas Reports at (202) 586-6050.

S. API's unopposed motion to intervene in this proceeding is deemed granted by operation of law. 10 C.F.R. § 590.303(g).

T. Sierra Club's and APGA's motions to intervene are both granted.

Issued in Washington, D.C., on November 30, 2016.

Christopher A. Smith
Assistant Secretary
Office of Fossil Energy
