

An aerial night view of a city, likely Los Angeles, with a network of white lines and nodes overlaid on the buildings and streets, symbolizing connected lighting. The city lights are in shades of yellow, orange, and red, while the network lines are bright white.

# Empowering cities with connected lighting

Lessons from Los Angeles

# Public lighting is everywhere but connectivity is not

~215k  
street lights in LA

Lighting can account for up to 40% of a city's total energy consumption<sup>2</sup>

On average, public lighting is more than 20 years old<sup>3</sup>

2% of installed systems are connected globally, expected to reach 35% by 2025<sup>3</sup>

Public infrastructure should be  
as connected as we are

# Expanding into smart city

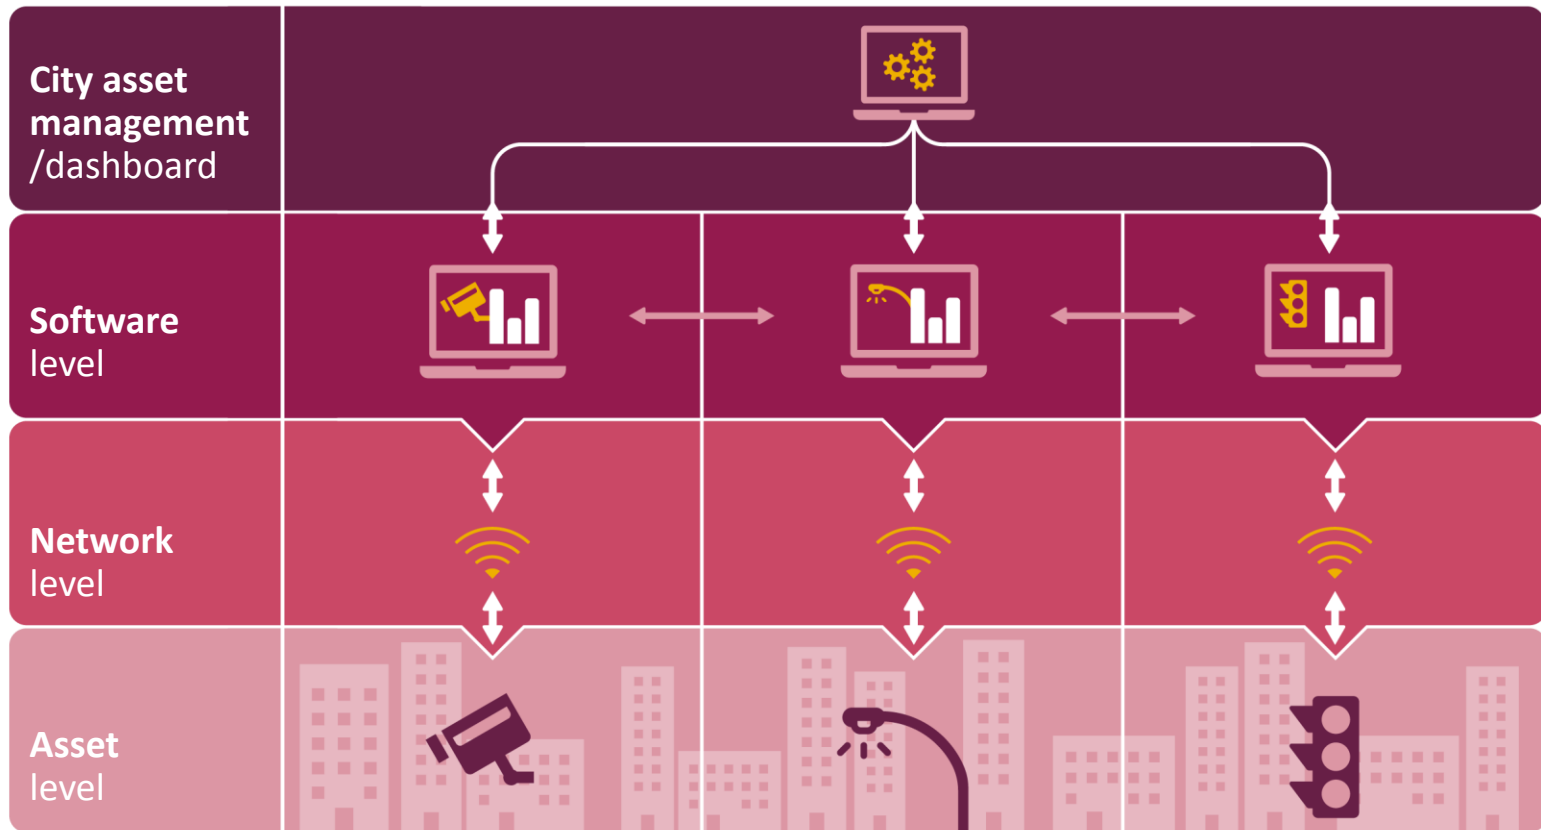

use cases that provide new value

An aerial night view of a city skyline, likely San Francisco, featuring numerous illuminated skyscrapers and a dense urban landscape. The lights are primarily yellow and white, with some blue and red accents on the buildings. The text "Open to exploring the power of city data" is overlaid on the lower-left portion of the image.

**Open to exploring**  
the power of city data

# Enable new opportunities via open, well-defined interfaces

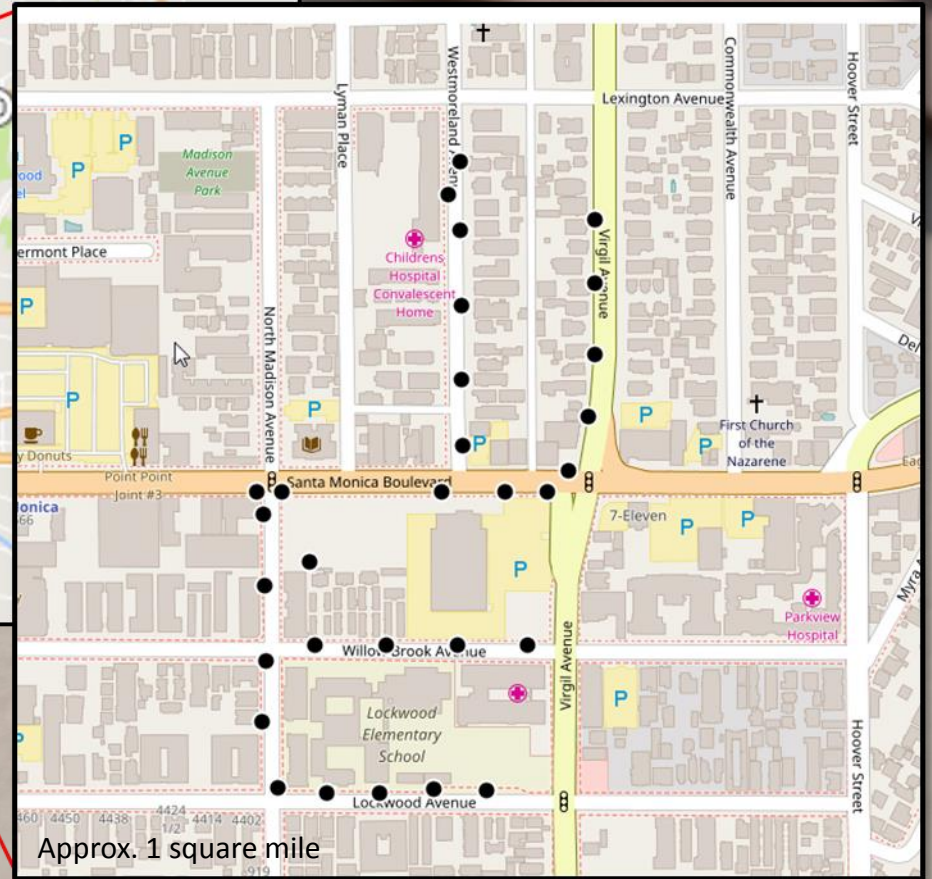

**Los Angeles is leading the way**  
by deploying connected lighting today

A photograph of a street lamp with a camera integrated into its fixture. The lamp is mounted on a pole and is positioned against a light-colored building wall. The camera is a small, white, rectangular device attached to the side of the lamp's housing. The lamp's arm is curved, and the fixture is a modern, rectangular design. The background shows a clear blue sky and the top edge of a brown roofline.

Leveraging existing  
infrastructure subtly  
integrated in plain sight

# Network health monitoring

## to ensure lights never go out

- **Average line voltage** over the test period **118.45V** (SD 28.56V) → Meets ANSI C84.1 standard (110-125V)
- Overall **Max. 125.8V**; overall **Min. 105.5V**
- Clearly **visible daily patterns** (e.g. voltage peaks between 2-3am daily)
- **Average line frequency 60Hz** (SD 2.52Hz) → Meets DOE requirements and FNET/GridEye Consortium
- Individual fixtures experienced some **extremes** (1% of total measurements) → Potential for advanced predictive maintenance models

# Network health monitoring

to ensure lights never go out

Average voltage fluctuation of a particular fixture throughout duration of the pilot (August 30<sup>th</sup> – November 22<sup>nd</sup>, 2016).

# Network health monitoring

to ensure lights never go out

Zooming in on cyclical patterns during the week of October 4<sup>th</sup>, 2016.

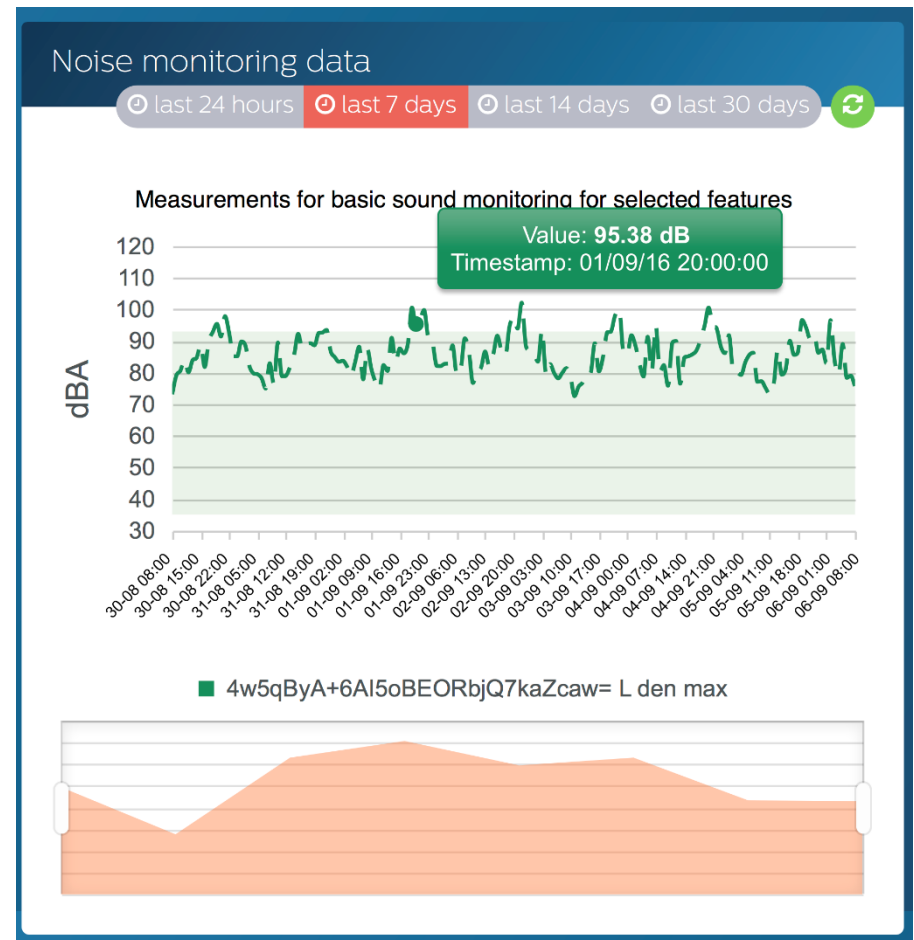

# Acoustic monitoring

# Environmental noise monitoring

provides continuous, dense data

- Generate continuous and dense data on urban noise
- Support city-wide planning decisions like traffic planning or school placement
- Inform and monitor public health initiatives related to environmental conditions

# Environmental noise monitoring

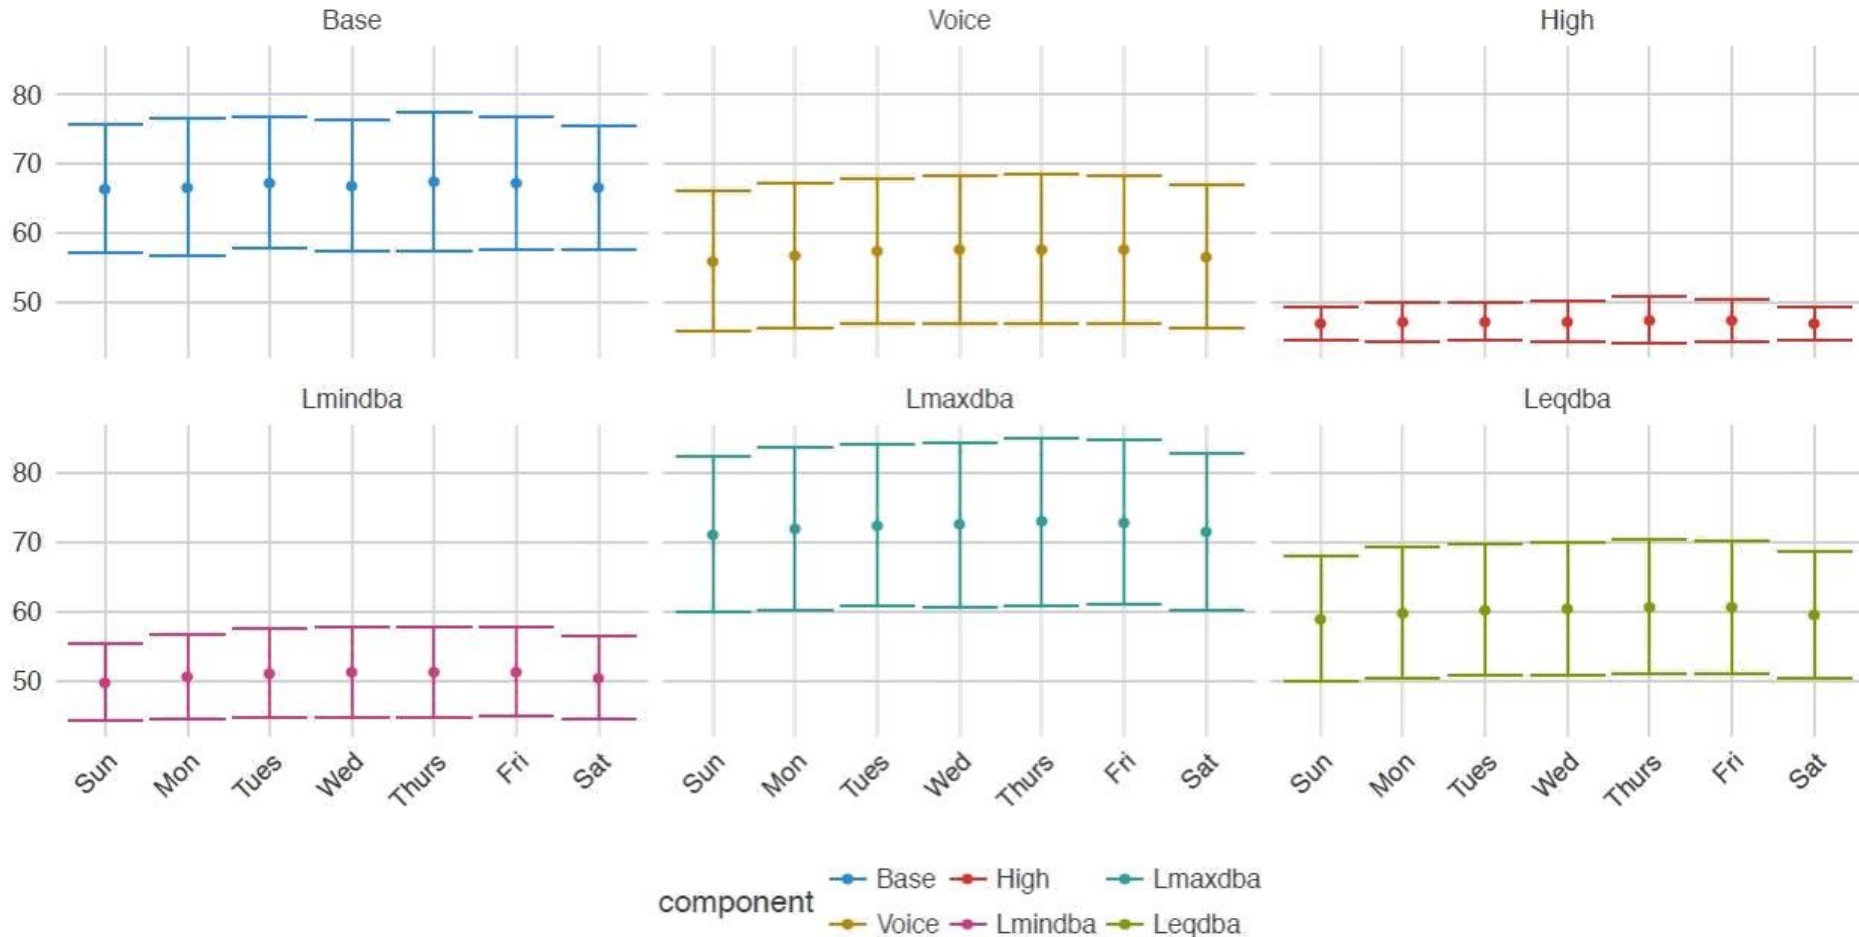

## provides continuous, dense data

- Average A-weighted loudness was 60 dB(a) (typical for moderate commercial area)
- Averages vary substantially by street (e.g. main streets 10 dB(a) higher than residential streets which are about 10 dB(a) lower)
- Rush hour peaks in the morning (6-7am) and afternoon (2-3pm) are visible
- Weekends are relatively consistent with weekdays however less variation

# Urban soundscape monitoring takes insights to the next level

- Monitoring and **alerts of sound levels** to track **compliance** with regulatory limits
- Handle **noise nuisance** complaints (e.g. local councils, housing associations and environmental health officers)
- Noise maps for **urban planning**
- Data: (A-weighted) sound pressure (min/max/av) (advanced use cases look at more frequency bands to extract more activity information)

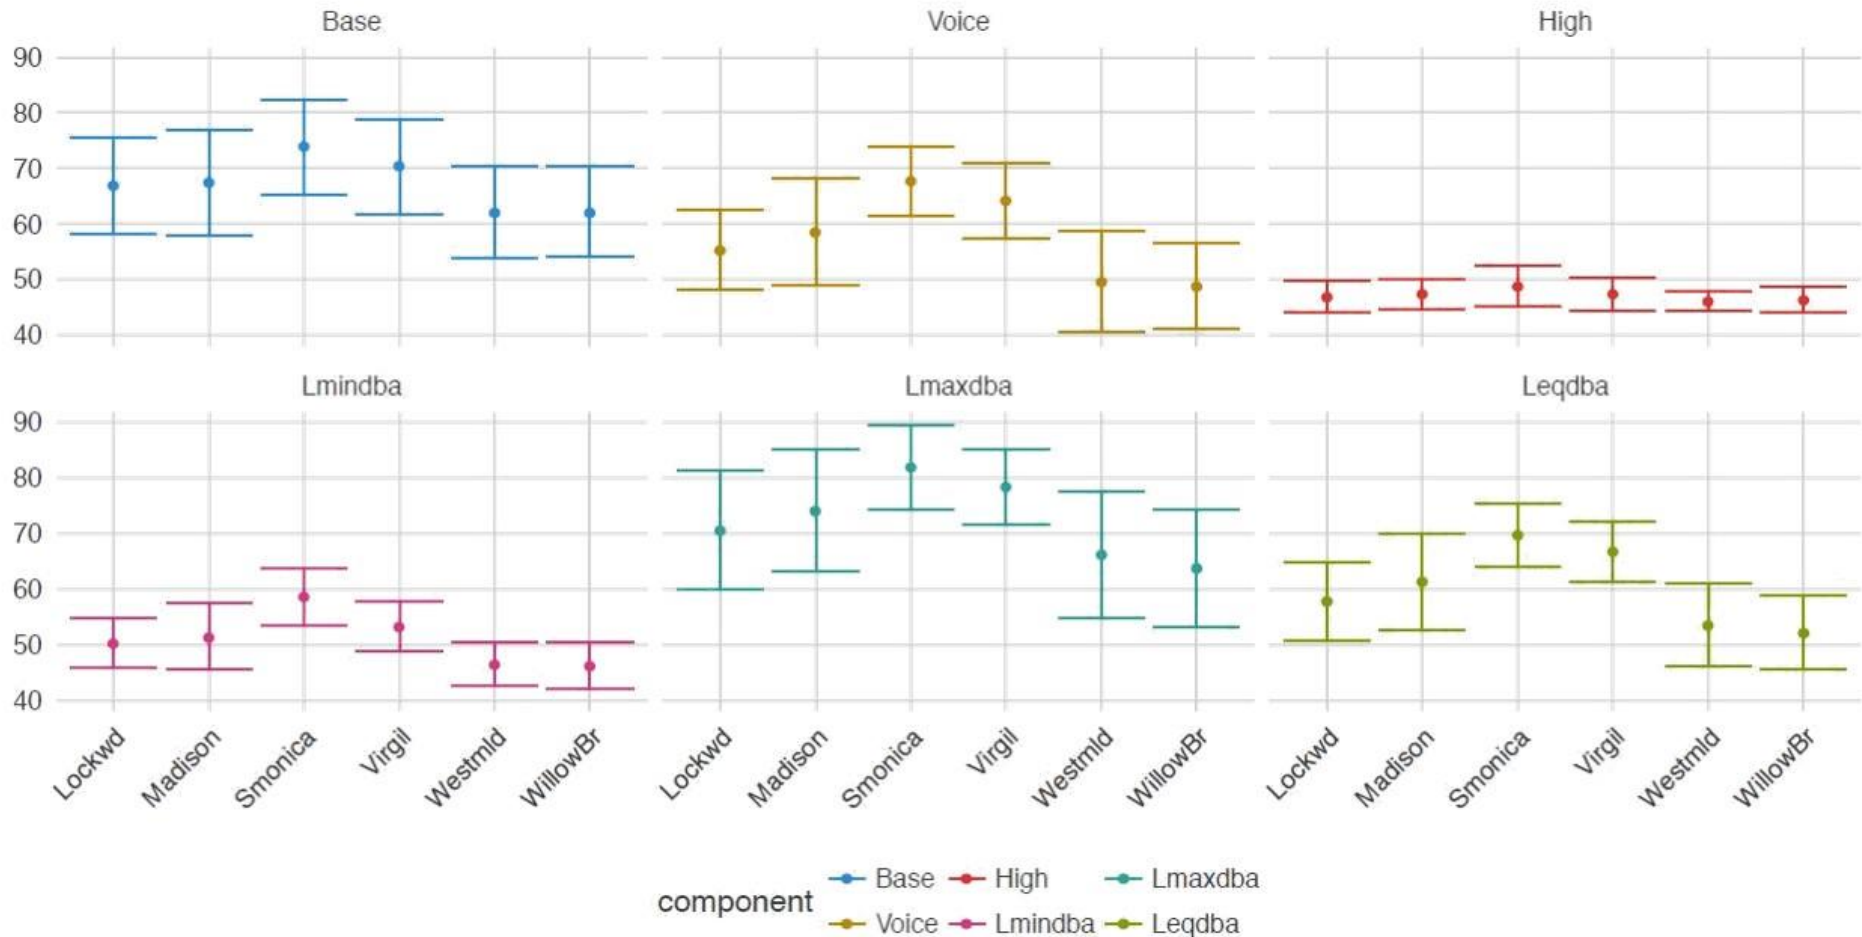

Examples of urban sound maps

# Exploring new value by leveraging existing, ubiquitous infrastructure

# Lessons learned on next steps towards smart cities

## **Architectures:**

- Extensible architectures
- Edge-computing benefits
- Cloud architecture for flexibility

## **Applications:**

- Dense temporal and spatial diagnostic data provides new insights
- Sound data presents many opportunities

## **Governance:**

- Data policies needed (e.g. LA Open Data Policy and Playbook)
- Frameworks for pilots drive innovation
