## General Comment

Local environmental impacts from CH<sub>4</sub> Leakage rates, shipping emissions, ect. are not fully being considered, as a benefit to Driftwood/Tellurian Investments investors. Driftwood/Tellurian Investments should act in good faith when sharing leakage rate statistics and their measurement's certainty analysis. Energy projects, in which foreign shareholders account for significant source of investments, should be regarded with due suspicion. There is much benefit for these forms of organizations to act unfaithfully, in the guise of protecting their shareholders.

Environmental impact, in the case of LNG production for global distribution, is most costly for the local source and shipment routes. From the perspective of the public, it does not make sense for the United States' natural resources to be inefficiently extracted and hurriedly sold to appease foreign markets and investors. American citizens are not properly receiving good/services in return for Driftwood/Tellurian Investments extraction of resources. The DOE does not appear to be concerned with these unbalanced, multilateral trade agreements. I am commenting that the DOE appears to be an indirect investor in projects such as Driftwood, at the cost of the American citizen. It is my belief that DOE will continue to move in the direction of supporting energy investors, happily neglecting the known and yet unknown costs to the American people.
