ID: DOE_FRDOC_0001-3256 The PI is of no benefit to communities but rather will lower property values, which is why Yucca Mt. is not being considered. Furthermore, it endangers the health of host communities and those along the transport routes. This is all the more true with the new outrageous PAGs which allow radiation exposure levels hundreds of times greater than that recommended (100s of mSv rather than the 0.25 mSv currently allowed by the EPA). Who will pay for the high cancer rates? Deaths? Will the PI owner operator? A private interim storage would have to allow surprise inspections by Federal and State agencies. Any owner-operator needs to be liable for restoring
the site to pre-accident background levels and not let off the hook, in the event of an accident and assume all costs related to the accident. This won't happen as they will declare bankruptcy. This means that they would need to pay into a fund in advance. There are only drawbacks to a private interim storage (PI). Nuclear waste storage must be owned and operated by US govt, not as a profit making entity. Then the govt might be able to afford to handle the waste correctly and innovation can be let in - currently it is locked out by large companies doing things cheaply for high cost. Nuclear waste should be stored in multiple hard-rock facilities - preferably granite and monitored for perpetuity. The northeastern reactors can put their waste in northeastern granite and mid-west in midwestern granite. Facilities must be kept open, filtered and monitored. The proposed parking lot uncovered facilities are unacceptable. Any temp parking of waste must be in hardened bunkers resistant to airplanes, constantly monitored, and filtered in the event of an accident. Energy Solutions has changed hands recently and now is owned by an investment banker (large Trump donor D. Kimmelman). It and WCS, which it is trying to purchase, are shielded from liability by multiple corporate levels. Privately owned Holtec has refused to give important cost related information to the government even when sued. Since it does not appear on the stock exchange there is virtually no public info about it. All of these waste companies seem to do everything on the cheap while charging the maximum. The US just agreed to pay for half of the clean-up of old uranium mine mess for mega-miner Freeport McMoRan. Better the waste facilities be public. The best way to contain costs while assuming safety is Fed government owned and operated with secondary monitoring at the state and local level. In short I oppose the Private Interim Storage. If you chose to move forward with a PI it must be covered, the building filtered, and the companies should pay for the accident in advance. I hope that with the new President you will start to care about our country, rather than the nuclear industry.
