ENERGY

Office of
**ENERGY EFFICIENCY &
RENEWABLE ENERGY**

BIOPRODUCTS

are already
part of our

EVERYDAY LIFE

MADE WITH **BIOMASS**

Bioenergy Technologies Office Impacts

There may be bioproducts on your desk right now! Over the past few years, the food industry has incorporated renewable biobased resources into packaging materials like potato chip bags and yogurt containers while the electronics industry has started incorporating it into resins used in wiring boards for computers and cell phones. The Department of Energy's Bioenergy Technologies Office is investing in technologies that will reduce costs and optimize the performance of these bioproducts.

Bioproducts are everyday products, materials, and chemicals derived from renewable plant and waste resources. When bioproducts are produced alongside biofuels, profits from the sale of bioproducts can help offset the costs of biofuels production. This contributes to more affordable and reliable domestic energy choices.
