Baseline Indoor Air Quality (IAQ) Field Study in Occupied New US Homes: Cold and Marine Climates

Performing Organization: Pacific Northwest National Laboratory
PI Name and Title: Dr. Jian Zhang and Cheryn Metzger, Senior Research Engineers
PI Tel and Email: j.zhang@pnnl.gov and cheryn.metzger@pnnl.gov; 707-623-7091
Baseline IAQ Field Study in Occupied New US Homes: Cold and Marine Climates

Team Lead: Pacific Northwest National Laboratory

Dr. Jian Zhang
Senior Engineer
Principle Investigator

Cheryn Metzger
Senior Engineer
Project Manager/Co-PI

Chrissi Antonopoulos
Scientist

Michael Baechler
Senior Scientist

Team Support: Cadmus and Washington State University

Steve Cofer/Mitt Jones
Principal/Associate Lead Field Technician

Mike Lubliner
Senior Energy Engineer
Member ASHRAE 62.2 Committee
Baseline IAQ Field Study in Occupied New US Homes: Cold and Marine Climates

The Problem (The Need/Challenge)

Problem Definition:
We all assume that the air we are breathing in our homes is safe and healthy. One goal of residential ventilation standards is to help design ventilation to provide acceptable indoor air quality (IAQ). However, as new homes are getting tighter and tighter to reduce the loss of conditioned air to the outside, the interaction between ventilation and indoor air quality becomes more and more exaggerated.

Research Question to be answered by this study: “How much does the air flow, and specifically, mechanical ventilation, affect the indoor air quality in new homes in the cold and marine climate zones?”

The Solution

• Measure humidity and indoor air pollutants in 64 new homes (1-2 weeks each), monitor use and performance of ventilation equipment, and track activities that can impact pollutant emission and removal.

• Investigate associations of indoor humidity and air pollutant concentrations with variations in house characteristics, including: ASHRAE-62.2 compliant mechanical ventilation, envelope air tightness and equipment location.
Baseline IAQ Field Study in Occupied New US Homes: Cold and Marine Climates

Advantage, Differentiation, and Impact

**Goal:** Inform future codes, standards and technology development about the interaction between indoor air quality and ventilation in homes with low infiltration.

**Timeline:**

<table>
<thead>
<tr>
<th>Activity</th>
<th>Lead</th>
<th>Timeline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finalize data collection protocols</td>
<td>LBNL</td>
<td>Nov 2017</td>
</tr>
<tr>
<td>Begin data collection</td>
<td>PNNL/FSEC</td>
<td>June 2018</td>
</tr>
<tr>
<td>End data collection</td>
<td>PNNL/FSEC</td>
<td>Sept 2019</td>
</tr>
<tr>
<td>Regional and national analysis</td>
<td>All</td>
<td>Mar 2020</td>
</tr>
</tbody>
</table>

**Impact:** Representative data for researchers to use to determine the relationships between air flows in homes and indoor air quality in the cold and marine climates (*42% of the country’s housing stock*).
Thank You
