EXECUTIVE SUMMARY

The purpose of this *Annual Transuranic Waste Inventory Report – 2016* (ATWIR-2016), using a cutoff date of December 31, 2015, is to document the updated inventory estimate of transuranic (TRU) waste reported by the TRU waste generator sites in the *Annual Transuranic Waste Inventory Report – 2015* (ATWIR-2015) (DOE 2015a) that had a cutoff date of December 31, 2014. This updated inventory information is provided to the U.S. Department of Energy (DOE) Carlsbad Field Office (CBFO) and is available to the DOE TRU waste complex, Waste Isolation Pilot Plant (WIPP) stakeholders, and regulators. The TRU waste inventory information is used for strategic planning, and supports DOE/CBFO's input into documents (e.g., WIPP Documented Safety Analysis and National Environmental Policy Act analyses), the development of new containers or shipping packages, planned change requests, and other design changes that may take place in the repository. Furthermore, if requested by DOE/CBFO, this report will provide the basis for the Performance Assessment Inventory Report for performance assessment (PA) modeling. This report focuses on the TRU waste stored or projected to be generated (up through calendar year [CY] 2050) at the TRU waste generator sites.

This ATWIR-2016 was developed from an annual inventory data update provided by the TRU waste generator sites and reflects the changes in the data that have occurred in the defense-related TRU waste inventory since the last published report. This inventory report includes estimates for TRU waste volumes, waste material parameters, packaging materials, complexing agents, oxyanions, and radionuclides (decayed to common years 2015 and 2033; see section 2.2.3). Changes to these parameters from the ATWIR-2015 are also presented.

Waste receipt and emplacement operations are still suspended since the events in February 2014 (the salt-haul-truck fire and the radiological release in Room 7, Panel 7). Consequently, no shipments were received and no waste was emplaced during CY 2015.

Subsequent to the events in February 2014, Los Alamos National Laboratory and Idaho National Laboratory shipped a small volume of TRU waste to Waste Control Specialists (WCS) near Andrews, Texas, for temporary storage. The waste temporarily stored at WCS is reported separately based on a query of the WIPP Waste Data System (WDS). The WCS waste is not disposed of at the WIPP, and is only reported to provide a comprehensive TRU waste inventory. Specific information on the waste temporarily stored at WCS may be obtained from the DOE/CBFO WDS administrator.

All TRU waste must meet the WIPP requirements (e.g., WIPP Waste Acceptance Criteria and the WIPP Hazardous Waste Facility Permit Waste Analysis Plan) before it can be disposed of at the WIPP, regardless of its designation or status in this report.

The body of this report presents updated data for volume, activity, waste material mass and chemical constituents. Table ES-1 presents an overview of the changes in the data that have occurred since the data reported in the ATWIR-2015. Specific details of these changes are discussed in section 3.0 of this report.

Table ES-1. Summary of Parameter Changes

Parameter	ATWIR-2015 Total	ATWIR-2016 Total	Net Change
Volume (m ³) ¹	1.52E+05	1.71E+05	1.82E+04
Waste and Packaging Material Mass (kg) ¹	8.48E+07	9.92E+07	1.44E+07
Radionuclide Activity (Ci) ^{1,2}	3.38E+06	5.19E+06	1.81E+06
Complexing Agents Mass (kg) ³	1.90E+04	2.24E+04	3.38E+03
Oxyanions Mass (kg) ³	8.20E+05	9.00E+05	8.08E+04

Data Source: CID Data Versions D.14.00 (LANL-CO 2015a) and D.15.00 (LANL-CO 2016a); Offner 2015; and INV-SAR-39 (Van Soest 2016). Note: Actual numerical values in this table are rounded to three significant figures for presentation within this report.

¹Data includes WIPP-bound waste streams at the TRU waste generator sites, waste emplaced at WIPP, and waste in temporary storage at WCS.

²Data decay-corrected through CY 2033.

³Data only includes WIPP-bound waste streams at the TRU waste generator sites.

1.0 INTRODUCTION

Each year, transuranic (TRU) waste inventory information is updated, reported in an annual transuranic waste inventory report, and provided to the U.S. Department of Energy (DOE) complex, Waste Isolation Pilot Plant (WIPP) stakeholders, and regulators. The ATWIR-2016 also provides the Carlsbad Field Office (CBFO) with an accurate, complete, and consistent TRU waste inventory to facilitate achieving national TRU waste disposal objectives and commitments. This report documents the updated total inventory of TRU waste as reported by the TRU waste generator sites. The inventory data used to develop this report support numerous tasks such as planned change requests, National Environmental Policy Act activities, design changes, identifying waste containing oxyanions and complexing agents, and various analyses such as the WIPP Documented Safety Analysis. In addition, this report provides the basis for the Performance Assessment Inventory Report (PAIR) for performance assessment (PA) modeling purposes, when requested by the DOE/CBFO.

Section 1.0 introduces the TRU waste inventory updates, the generator sites, the sources and the uses of the inventory information. Section 2.0 describes the methodology used to develop and compile the inventory information. Section 3.0 discusses the TRU waste updated inventory estimates and the changes in the data since the last published report, the *Annual Transuranic Waste Inventory Report – 2015* (ATWIR-2015) (DOE 2015a), with a data cutoff of December 31, 2014. Section 4.0 discusses potential TRU waste streams. Section 5.0 presents a summary of this report, section 6.0 provides a glossary, and section 7.0 provides references used for this report. This report contains four appendices. Appendix A presents the WIPP-bound waste profile reports (WPRs), Appendix B presents the WPRs for potential waste streams, Appendix C presents the historic crosswalk of waste streams, and Appendix D contains the potential waste stream screening memorandum (Patterson 2010).

This ATWIR-2016 was prepared by the Los Alamos National Laboratory – Carlsbad Operations (LANL-CO) TRU Waste Inventory Team for the DOE/CBFO. The work for this report was performed under the DOE/CBFO *Quality Assurance Program Document* (QAPD) (DOE 2015b). The processes used by the LANL-CO TRU Waste Inventory Team to collect, maintain, and report inventory information are graded and implemented to QAPD requirements under the LANL-CO Quality Assurance (QA) Program, which includes the software QA procedures used to qualify the Comprehensive Inventory Database (CID) and other software used in the development of this report. LANL-CO software QA is documented in LCO-QPD-02, *LANL-CO Software Quality Assurance Plan* (LANL-CO 2015b), and LCO-QP19-1, *Software Quality Assurance* (LANL-CO 2015c).

1.1 Annual TRU Waste Inventory Updates

TRU waste inventory information changes frequently at the TRU waste generator sites; therefore, the inventory is updated on an annual basis. This report is an update based on the sites' estimated inventory as of December 31, 2015.

Since the ATWIR-2015, a number of changes and improvements have occurred that affected the volume, non-radiological, and radiological characteristics of TRU waste streams. These changes were based on:

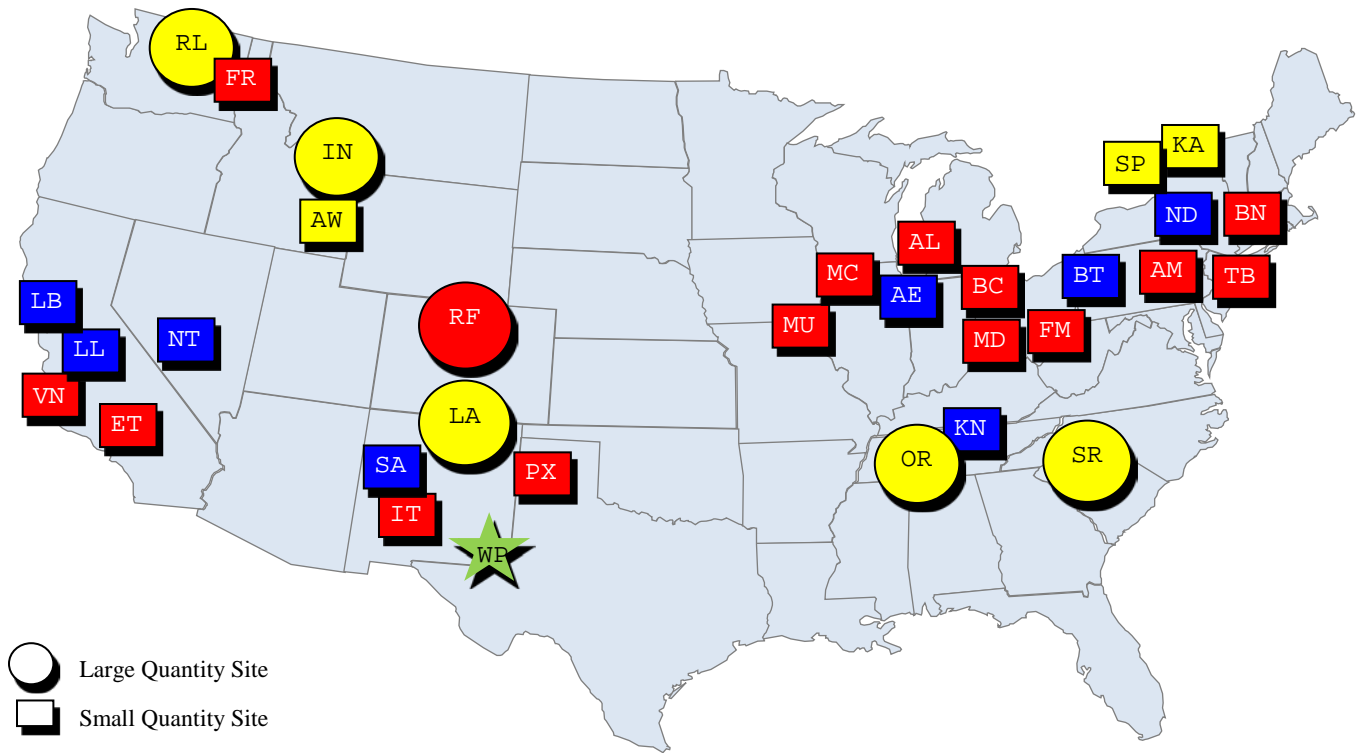

- Addition of 32 new waste streams
- Addition of a TRU waste generator site
- Addition of approximately 5,010 cubic meters (m³) of projected waste (6 metric tons of plutonium [Pu] oxide) to the inventory as directed by DOE in response to a Record of Decision.
- Increase of about 7,960 m³ of projected soil remediation and decontamination and decommissioning (D&D) waste
- Projected TRU waste generation estimates reported through 2050 instead of 2033
- Addition of about 2,200 100-gallon drums that were inadvertently omitted by a TRU waste generator site
- Updated fill factors for final waste containers

1.2 TRU Waste Generator Sites

TRU waste is currently stored at both small quantity sites and large quantity sites (LQSs) across the country, as seen in Figure 1-1. This figure presents the DOE TRU waste generator sites, which are divided into three categories, as of December 31, 2015: active TRU waste generator sites (yellow), sites de-inventoried of all TRU waste (red), and sites that were de-inventoried of their legacy TRU waste but continue to manage additional defense TRU waste (blue). One site, the Separations Process Research Unit (SPRU) has been re-introduced as an active site since some TRU waste was discovered on the site during D&D.

There are three TRU waste generator sites not shown in Figure 1-1 that report only potential TRU waste: West Valley Demonstration Project (WV), Hanford Site - Office of River Protection (RP), and Babcock and Wilcox Nuclear Energy Services (BL). Potential TRU waste is discussed in section 4.0 of this report.

- WP Waste Isolation Pilot Plant

1.3 Temporary Storage of TRU Waste

Waste receipt and emplacement operations are still suspended since the events in February 2014 (the salt-haul-truck fire and the radiological release in Room 7, Panel 7). Consequently, no shipments were received and no waste was emplaced during calendar year (CY) 2015. The TRU waste generator sites continued to characterize and certify TRU waste using the existing certification program, and built backlogs of TRU waste so that there will be sufficient certified waste ready to ship when WIPP reopens.

Subsequent to the events described above, Los Alamos National Laboratory (LANL) shipped TRU waste to Waste Control Specialist, LLC (WCS) near Andrews, Texas, to meet LANL's cleanup commitment to the State of New Mexico to remove 3,706 m³ of TRU waste stored above ground at Area G. In addition, Idaho National Laboratory (INL) shipped a small volume of TRU waste to WCS. All shipments to WCS were suspended in 2014; however, the waste that remained at WCS is accounted for in this report. Since the inventory parameters for the waste temporarily stored at WCS can be directly provided by the WIPP Waste Data System (WDS), the waste temporarily stored at WCS is reported separately in Table 3-3, Table 3-5, and Table 3-11. These values are based on a query of the WDS. The WCS waste is not disposed of at WIPP, and is only reported to provide a comprehensive TRU waste inventory. Specific information on the waste temporarily stored at WCS may be obtained from the DOE/CBFO WDS administrator.

1.4 Sources of Transuranic Waste Inventory Information

The sources of TRU waste inventory information are: 1) the ATWIR-2015, 2) updated information provided by the TRU waste generator sites, 3) Acceptable Knowledge (AK) reports, and 4) WDS, the official database of record for waste emplaced in WIPP. Each year, the sites updated their data from the previous year. For ATWIR-2016, the TRU waste generator sites began with the inventory data from the ATWIR-2015, and they updated the information using data obtained from their site-specific databases and AK reports which provide information, such as chemical lists and radionuclides, pertaining to waste streams being characterized.

1.5 Uses of Transuranic Waste Inventory Information

Waste stream volumes are accounted for in both "current form" (current packaging) and "final form" (planned WIPP-compliant packaging) configurations. These configurations are useful in various waste management scenarios. In past years, DOE/CBFO management has used this inventory information to support strategic decisions related to waste retrieval, treatment, repackaging, characterization, shipment, and disposal for both stored and projected waste initiatives. Also, site-specific project plans and schedules, which detail approaches for moving TRU waste to WIPP, were developed and are updated, as requested, based on current TRU waste inventory information. When inventory data are needed for PA modeling, DOE/CBFO will request a PAIR that provides the latest inventory data that are scaled to model a full repository.

In addition to radiological information, DOE has many reasons for obtaining and tracking non-radiological information about the TRU waste destined for WIPP. For example, DOE tracks the waste materials that go into the WIPP repository, such as cellulose, plastic, and rubber

(CPR), which may affect gas generation and the amount of magnesium oxide emplaced in the repository (EPA 1996).

2.0 METHODOLOGY

This report was generated using documented processes and methods that are qualified under the LANL-CO QA Program (see section 1.0). The following steps were completed to generate this report (see Figure 2-1):

1. Collected TRU waste stream information from the TRU waste generator sites.
2. Performed a thorough review of all data to check for accuracy, consistency, and completeness.
3. Performed analyses, where appropriate.
4. Entered the updated information in the CID and verified it.
5. Obtained the validation of the updated CID information from the DOE TRU waste generator site representatives.
6. Generated the required data tables by decaying the radionuclides and performing necessary calculations in the CID.

2.1 Collection, Compilation, Verification, and Validation of Inventory Information

The process used to collect TRU waste inventory from the generator sites and to enter the data into the CID is documented in LANL-CO procedure INV-SP-01, *Data Collection and Entry for the Comprehensive Inventory* (LANL-CO 2016b). On December 22, 2015, in accordance with this procedure, a letter was sent from DOE/CBFO (Patterson 2015) to TRU waste generator sites requesting the annual TRU waste inventory update. The Inventory Team then sent each site a notification of the update with an attached Microsoft[®] Excel data template (DT) workbook file containing last year's validated data along with guidance explaining the steps required to update the DT information.

The TRU waste generator sites were asked to update the information on their site's waste streams. The site designates each waste stream as either WIPP-bound or potential. The data for WIPP-bound waste streams are discussed in section 3.0 and potential waste streams are discussed in section 4.0. The data for WIPP-bound waste streams are used for PA calculations; however, the data for potential waste streams are not included in PA calculations. Regardless of its designation in this report, TRU waste must meet all WIPP requirements (e.g., WIPP Waste Acceptance Criteria [WAC], WIPP Hazardous Waste Facility Permit Waste Analysis Plan [WAP]) before it can be disposed of at the WIPP.

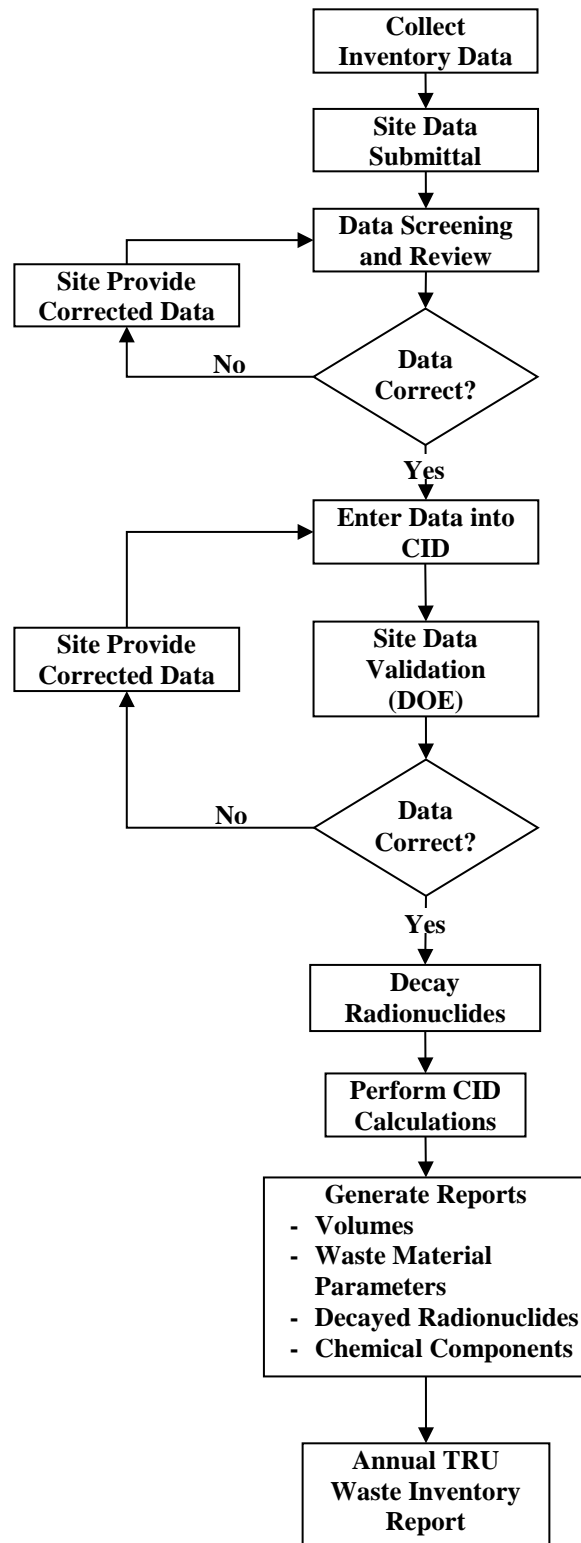

The Inventory Team worked with personnel from every generator site to assist in the updating process and to resolve issues. After the DTs were completed, the team checked them for accuracy and consistency. During these data checks, the Inventory Team verified that the

inventory updates included all of the available information. The Inventory Team contacted the sites if there were any completeness, accuracy, or consistency issues. The data checks included, but were not limited to:

- Verification that WIPP-bound waste streams contain all required information, and potential waste streams meet the screening memo criteria as discussed in section 4.0;
- Verification of radionuclide isotopic inputs (e.g., confirm TRU alpha concentration is greater than 100 nanocuries per gram);
- Verification of radionuclide threshold limits to determine if the waste stream appears to be categorized correctly as contact-handled (CH) or remote-handled (RH);
- Verification that activity concentration for RH-TRU waste streams does not exceed the WIPP Land Withdrawal Act (LWA) limits (i.e., sites report less than 23 curies per liter [Ci/l] averaged over the volume of the RH-TRU canister);
- Verification that waste does not exceed mass limits for reported final form container types;
- Verification that complexing agents and oxyanions identified in AK are reported during data update;
- Verification that the waste matrix code group is consistent with the waste material parameters (WMPs) reported;
- Comparison of the ATWIR-2016 waste stream data to the ATWIR-2015 waste stream data to identify and understand any significant differences.

Once all issues were resolved, the TRU waste inventory information was uploaded from the Microsoft® Excel DT or entered manually into the CID. Once the data were entered and verified, waste stream data reports were prepared and sent to the DOE TRU waste generator site representative (manager or designee). A validation letter signed by the DOE TRU waste generator site representative and site contractor (contractor signature optional) documented the correctness of the information as reported in the CID. Hard copies of the waste stream data reports and signed validation letters were then submitted to the LANL-CO Record Center. The CID data were then labeled as data version D.15.00 and protected from further revision. Figure 2-1 presents a flow chart of the TRU waste inventory process.

Figure 2-1. TRU Waste Inventory Process Flowchart

2.2 Data Generated from CID Reports

Data tables included in this report were generated from the CID. The CID is a DOE/CBFO database developed by LANL-CO and qualified in accordance with the LANL-CO QA Program, which is in compliance with the DOE/CBFO QAPD. The LANL-CO software QA Program is documented in LCO-QPD-02, *LANL-CO Software Quality Assurance Plan* (LANL-CO 2015b), and LCO-QP19-1, *Software Quality Assurance* (LANL-CO 2015c). The CID is used to manage, maintain, and perform specific qualified calculations using inventory data. The data are then used to generate qualified data reports and tables.

The TRU waste generator sites were asked to update the information for each waste stream's current and final form volume and to provide data that reflected the total composition of each waste stream's WMPs, radionuclides, and chemical components. For the WMPs and radionuclides update, the sites were asked to report only the data for the stored waste (already generated but not shipped), even if the waste stream included waste that is projected (will be generated in the future [through CY 2050], including D&D waste). The CID then derived projected mass and activity based on the projected-to-stored volume ratio for each waste stream; however, if a waste stream consisted only of projected waste, then the sites reported their estimates of the projected data for that particular waste stream. The anticipated data were calculated by summing the stored and projected data. The stored, projected, and anticipated values for volumes, WMPs, radionuclides, and chemical components, presented throughout this report are aggregate sums of the individual waste stream values for the specified categories (site, handling designation, etc.).

Information for waste emplaced at WIPP and in temporary storage at WCS was obtained from the DOE/CBFO WDS administrator (see section 2.3). After this information was transformed for use in the CID (Van Soest 2016), the WIPP and WCS data were then imported into the CID.

2.2.1 Volume Reporting

The waste stream volume information collected from the TRU waste generator sites includes stored and projected waste. The sites also report both current form and final form waste container information for their waste streams. The current form represents the waste in its current packaging configuration. The final form represents estimates of the WIPP-compliant container type(s) that will ultimately be used to ship the waste to WIPP. Each final form container type's stored and projected counts are calculated from the waste's current form volume, taking into account other factors such as repackaging, treatment, and regulatory limits, when available.

The final form stored and projected waste stream volumes were derived by applying standardized WIPP-approved container type volumes, which are maintained within the CID, to the respective stored and projected container type counts reported by the TRU waste generator sites. In this report, CH-TRU waste volume in overpacks reflects the outer container volume and the RH-TRU waste volume in overpacks reflects the inner container volume.

Appendices A and B present data on stored and projected volume for current form and final form container types for each waste stream.

2.2.2 Waste Material Parameter and Packaging Materials Reporting

The WMPs are non-radiological materials present in TRU waste. The TRU waste generator sites reported the total mass of each waste stream's WMPs under the following categories, where applicable:

- Aluminum-based Metal/Alloys – Aluminum or aluminum-based alloys in the waste materials.
- Cellulose – Material generally derived from high-polymer plant carbohydrates (e.g., paper, cardboard, Kimwipes[®], wood, cellophane, and cloth).
- Cement – An agent used to solidify liquid, particulate, and sludge. Cement may be reacted (hydrated by setting up under aqueous conditions), or unreacted (added under dry, non-aqueous conditions as an absorbent or neutralizer).
- Iron-based Metal/Alloys – Includes iron and steel alloys in the waste, but does not include the waste container materials. Also includes an iron-based metallic phase associated with any vitrification process, if applicable.
- Other Inorganic Materials – All other inorganic non-metal waste materials (e.g., concrete, glass, firebrick, ceramics, graphite, sand, and inorganic sorbents) not categorized under Solidified Inorganic Material.
- Other Metal/Alloys – All other metal/alloys (e.g., copper, zirconium, tantalum), not categorized under Aluminum- or Iron-based Metal/Alloys, including the lead portion of leaded rubber gloves/aprons.
- Plastic – Generally man-made, often derived from petroleum feedstock (e.g., polyethylene, polyvinyl chloride, Lucite[®], and Teflon[®]).
- Rubber – Natural or man-made elastic latex materials, such as Hypalon[®], neoprene, surgical gloves, and leaded-rubber gloves (rubber portion only).
- Solidified Inorganic Material – Any homogeneous material consisting of sludge or aqueous-based liquid that has been solidified (e.g., wastewater treatment sludge and inorganic particulates).
- Solidified Organic Material – Organic resin, solidified organic liquid, and sludge.
- Soil – Generally consists of naturally occurring soil that has been contaminated with radioactive waste materials at a high enough level to be considered TRU waste.
- Vitrified – Waste that was melted or fused at high temperatures with glass-forming additives (e.g., soil or silica), in appropriate proportions to result in a homogeneous

glass-like matrix. (Unoxidized metallic phases, if present, are included in the Iron-based Metal/Alloys category.)

The packaging materials (PMs) are non-radiological materials (steel, plastic, cellulose, rubber and lead) used as components of the WIPP-approved containers that hold TRU waste. The PM masses for all WIPP-approved payload containers are maintained in the CID, which uses these values to generate each waste stream's overall PM makeup based upon the respective final form containers reported by the TRU waste generator sites. These PMs are standardized and defined for each WIPP-approved container type and reported in INV-SAR-19, *Analysis of Container Material Masses* (French 2009), and in a memo to the Quality Assurance File QAM-12-17 (Van Soest 2012).

Appendices A and B present a list of average WMP and PM densities expressed as kilograms/cubic meter (kg/m^3) for each waste stream. These densities were calculated by dividing the total mass of each material by the total final form volume for each waste stream.

2.2.3 Radionuclide Reporting

The TRU waste generator sites reported the activity of each radionuclide for their waste streams. In addition, they provided the most recent assay year or projected generation year for each waste stream. These assay years were used to determine the time basis for decay and buildup calculations ("decay-correction").

The sites provided radionuclide data, which may or may not have included the complete set of associated daughters. Since the site data consisted of radionuclide activities at the date of assay, which varied for each waste stream, they were decay-corrected to common dates for reporting purposes, with these results being reported for the end of CY 2015 and CY 2033 (see section 3.3). Radionuclides are decayed through 2015 to bring all sites' radionuclides to the common collection year. Radionuclides are also decayed through 2033, which allows the current reported activity to be compared to previously reported activity. The CID automates the radionuclide decay process by using the *Oak Ridge Isotope Generation and Depletion Code* (a module of *Standardized Computer Analysis for Licensing Evaluation* [SCALE] 6) (ORIGEN-S) (ORNL 2009), which is a depletion and decay library that has been qualified for use under the LANL-CO QA Program, in accordance with LCO-QPD-02 and LCO-QP19-1. The CID first exports the radionuclide activities reported by the TRU waste generator sites in the form of ORIGEN-S input files for each waste stream. Next, the CID executes ORIGEN-S in a sequential fashion for each input file, where the radionuclide decay and buildup calculations are performed and written to an output file. Finally, each output file is read and imported back into the CID, resulting in decay-corrected radionuclide tables generated for this report.

Appendices A and B present a list of average radionuclide concentrations (Ci/m^3) for each waste stream. These concentrations were calculated by dividing the total activity of each radionuclide by the total final form volume for each waste stream. The radionuclides in Appendix B are not decay-corrected.

2.2.4 Chemical Component Reporting

The TRU waste generator sites reported stored and projected mass separately for each waste stream's complexing agents (acetic acid, citric acid, oxalic acid, acetate, citrate, oxalate, and ethylenediaminetetraacetic acid [EDTA]), oxyanions (nitrates, phosphates, and sulfates), and other chemical components (e.g., asbestos, beryllium, and graphite). Because of the February 14, 2014, radiological release at WIPP, it is important to re-emphasize that chemicals, along with other waste components identified in this report, must meet all WIPP requirements before the waste can be shipped for disposal at WIPP.

2.3 Analyses Supporting the Annual Transuranic Waste Inventory Report

In addition to collecting and processing information from the DOE TRU waste generator sites and securing the site information in a qualified database for future use, an analysis was performed and documented in accordance with LANL-CO QA procedure LCO-QP9-1, *Analyses* (LANL-CO 2013), to support the preparation of this report.

To update the TRU waste emplaced inventory data within the CID, a documented request was made of the DOE/CBFO WDS database administrator to supply data for the waste emplaced in the WIPP repository, en route to WIPP, or in above-ground storage at WIPP or other designated storage location (WCS), as of December 31, 2015. The WDS data were migrated into a standardized CID Import Template (CIT) file, which required that the original WDS data undergo various transformations including, but not limited to, calculations, aggregations, and data mapping. These activities and calculations are documented in INV-SAR-39, *WDS Data Transformation for Insertion in the 2015 Inventory CID Import Template* (Van Soest 2016). The CIT file was subsequently imported into the CID to update the emplaced TRU waste information. Additional transformations were developed and included in this analysis for waste streams with waste containers residing in more than one location (WIPP underground, WIPP above ground, or WCS). By using different waste stream identification prefixes, these waste streams were separately transformed and tracked in the CIT file for each location reported. The ability to attain better emplaced waste stream data for waste streams with containers residing in multiple locations resulted in negligible differences when compared to last year's emplaced PM mass and activity reported for containers located at the WIPP and WCS, which are described in detail in sections 3.2.2 and 3.3.2, respectively.

3.0 TRANSURANIC WASTE INVENTORY ESTIMATES AND CHANGES

This section presents the TRU waste inventory data that were collected using the methodology discussed in section 2.0. These data were labeled and secured as CID data version D.15.00 (LANL-CO 2016a). Actual numerical values in this section are rounded to three significant figures for presentation purposes within this report.

The emplaced and temporary storage inventory totals reported from the WDS are presented as summations under WIPP (Emplaced) and WCS (Temporary Storage), respectively, under the specific component subsections (e.g., volumes, WMPs and PMs, and radionuclides) and are not included in the data reported by the sites. Chemical components are not reported in the

emplaced or temporary storage inventory because the WDS does not track these components. More specific information on the waste emplaced or temporarily stored at WCS can be obtained from the DOE/CBFO WDS administrator at the WIPP Information Center at 1-800-336-WIPP (9477) or at infocntr@wipp.ws. The WDS is the official database of record including container-level data on the emplaced TRU waste.

3.1 TRU Waste Volume Estimates

This section presents the TRU waste inventory final form volume estimates for CH- and RH-TRU waste and a discussion of changes since the ATWIR-2015.

3.1.1 TRU Waste Inventory Total Volumes by Site

The tables of this section present only final form data. Section 2.2 describes how volumes are reported. The sites' current form container types and volumes by waste stream are listed in the waste profiles in Appendices A and B.

Table 3-1 shows the total CH-TRU stored, projected, and anticipated waste volumes. An estimated anticipated final form total of 76,000 m³ of CH-TRU waste is currently being reported at the sites and could be shipped to WIPP in the future, provided all WIPP requirements are met. Approximately 97% of the anticipated CH-TRU waste is stored or will be generated at LQs: Hanford (Richland) Site (RL), INL, LANL, Oak Ridge National Laboratory (ORNL), and the Savannah River Site (SRS).

Table 3-2 shows the total RH-TRU stored, projected, and anticipated waste volumes. An estimated anticipated final form total of 3,160 m³ of RH-TRU waste is currently being reported by the sites and could be shipped to WIPP in the future, provided all WIPP requirements are met. Approximately 92% of the anticipated RH-TRU waste is stored or will be generated at LQs: RL, INL, LANL, ORNL, and SRS.

Table 3-1. CH Waste Inventory Total Volumes

TRU Waste Generator Site	Stored Volumes (m ³)	Projected Volumes (m ³)	Anticipated Volumes (m ³)
Argonne National Laboratory	5.14E+01	1.16E+02	1.68E+02
Hanford (Richland) Site	1.59E+04	1.15E+04	2.75E+04

Data Source: CID Data Version D.15.00 (LANL-CO 2016a). Note: This table only contains data for WIPP-bound waste streams at the TRU waste generator sites.

3.1.2 Changes to TRU Waste Volumes

Table 3-3 shows the net changes for final form total volumes (anticipated) of the combined CH- and RH-TRU waste between the ATWIR-2015 and this report. The net change column includes both increases and decreases in waste streams as reported by the sites and the volume of emplaced waste and waste in temporary storage taken from the WDS. The net anticipated volume reported by the sites overall increased 18,200 m³. The largest contributors to the volume increase are from Hanford, SRS and LANL. The estimated projected volume for Hanford's RL200-02 waste stream increased approximately 6,960 m³, based on a remedial design and action work plan addressing projected soil remediation and D&D activities. As directed by DOE in response to a Record of Decision, SRS added the new waste stream, SR-KAC-PuOx, which

contributed approximately 5,010 m³ of projected waste (6 metric tons of Pu oxide) from K-Area. LANL's projected volume increased by approximately 2,580 m³. LANL's increase included the adjustments based on reporting projected waste through 2050.

Table 3-3. CH/RH Waste Volume Changes

TRU Waste Generator Site	ATWIR-2015 Total (m ³)	ATWIR-2016 Total (m ³)	Net Change (m ³)
Hanford (Richland) Site	2.19E+04	2.94E+04	7.51E+03
Idaho National Laboratory	2.08E+04	2.20E+04	1.17E+03
Los Alamos National Laboratory	6.21E+03	8.79E+03	2.58E+03

3.2 Non-Radiological Material Estimates

This section presents the non-radiological properties (WMPs, PMs, and chemical components) of the TRU waste inventory as reported by the TRU waste generator sites, and a discussion of changes to the data since the ATWIR-2015.

3.2.1 Waste Material Parameters and Packaging Materials

WMPs and PMs for CH- and RH-TRU waste are reported as final form anticipated mass, and are presented in Table 3-4. See section 2.2 for details on how WMPs and PMs are derived.

Table 3-4. CH/RH Waste and Packaging Material Parameter Inventory

Waste Material	CH Mass (kg)	RH Mass (kg)	Total Mass (kg)
Iron-based Metal/Alloys	4.55E+06	4.08E+05	4.96E+06
Aluminum-based Metal/Alloys	3.42E+05	1.70E+04	3.59E+05
Other Metal/Alloys	3.41E+05	3.47E+05	6.87E+05

Packaging Material, Steel	1.30E+07	2.98E+06	1.60E+07
Packaging Material, Lead	--	1.21E+04	1.21E+04
Grand Total	4.47E+07	5.54E+06	5.02E+07

Data Source: CID Data Version D.15.00 (LANL-CO 2016a). Note: This table only contains data for WIPP-bound waste streams at the TRU waste generator sites.

3.2.2 Waste and Packaging Material Parameter Changes

The changes in WMP and PM data between the ATWIR-2015 and this report are presented in Table 3-5. Data for the WMPs and PMs improve as additional waste is characterized and the sites apply the information to estimate the WMPs remaining in that waste stream at the site. The net change column includes both increases and decreases in waste streams as reported by the TRU waste generator sites. Since no waste was shipped or received at WCS during CY 2015, the waste in temporary storage at WCS reported from the WDS did not change.

As shown in Table 3-5, the total change in anticipated WMP mass increased by approximately 9.61 million kg and anticipated PM mass increased by approximately 4.83 million kg. The increase in anticipated WMPs and in anticipated PMs can be attributed primarily to Hanford's RL200-02 and SRS's newly added SR-KAC-PuOx waste streams. Hanford's RL200-02 waste stream was the largest WMP mass increase contributor by approximately 7.68 million kg based on an estimated increase from projected soil remediation and D&D activities. SRS's newly added SR-KAC-PuOx waste stream accounted for the largest PM mass increase with approximately 2.70 million kg, which represents the projected packaging associated with the 6 metric tons of Pu oxide in K-Area.

For waste emplaced at WIPP and in temporary storage, the WMP mass increased 0.18 kg and the PM mass decreased 30.8 kg. These negligible changes are a byproduct of an inventory methodology change in which the WCS and WIPP above-ground wastes were assigned to separate waste streams from their WIPP underground counterparts (Van Soest 2016). Previously, the WCS, WIPP aboveground, and WIPP underground waste streams were combined. In implementing this methodology change, a portion of WIPP's inventory of SWBs

changed to include liners and a portion of WCS's inventory of standard waste boxes (SWBs) changed to not include liners, netting one less liner than previously reported. This effectively reduced the plastic PM mass by approximately 30.8 kg.

Table 3-5. CH/RH Waste and Packaging Material Inventory Changes

Waste Material Parameter	ATWIR-2015 Total (kg)	ATWIR-2016 Total (kg)	Net Change (kg)
Iron-based Metal/Alloys	4.62E+06	4.96E+06	3.47E+05
Aluminum-based Metal/Alloys	3.29E+05	3.59E+05	3.03E+04

3.2.3 Chemical Components

This report is the mechanism DOE uses to track chemical components (e.g., complexing agents and oxyanions) for anticipated TRU waste at the sites. The chemical component mass totals for this report are presented in Table 3-6. The changes to complexing agents and oxyanions are listed in Table 3-7.

3.2.3.1 Complexing Agents and Oxyanions

DOE tracks the mass of complexing agents and oxyanions destined for emplacement in the WIPP repository because of their potential impact on solubility of actinides and gas generation in the waste. Table 3-6 presents a summary of the anticipated mass estimated for the CH- and RH-TRU waste complexing agents and oxyanions by site and the grand totals of each.

Table 3-6. CH/RH Complexing Agent and Oxyanion Mass (kg) by Site

Data Source: CID Data Version D.15.00 (LANL-CO 2016a). Note: This table only contains data for WIPP-bound waste streams at the TRU waste generator sites.

3.2.3.2 Changes to Complexing Agents and Oxyanions

Table 3-7 shows the changes in the total estimated CH- and RH-TRU waste complexing agents and oxyanions between the ATWIR-2015 and this report. These data represent only the complexing agents and oxyanions that are currently being reported by the TRU waste generator sites and do not include complexing agents or oxyanions emplaced at the WIPP or in temporary storage since they are not reported in WDS.

As shown in Table 3-7, the total change in anticipated complexing agent mass was an increase of 3,380 kg and the total change in anticipated oxyanion mass was an increase of 80,800 kg.

The largest increase in complexing agents is primarily attributed to Hanford's RLPFP-01 waste stream. Hanford's complexing agent increase is based on revised waste projections from ongoing D&D efforts.

The largest increases in oxyanions are primarily attributed to Hanford and ORNL waste streams. Hanford's RLPFP-01 added approximately 43,700 kg (22,700 kg nitrate, 19,700 kg phosphate, and 1,300 kg sulfate) from newly projected estimates based on ongoing D&D efforts. ORNL's newly projected waste stream OR-REDC-RH-HOM contributed 29,600 kg nitrate.

Table 3-7. CH/RH Complexing Agent and Oxyanion Changes

Chemical Component	ATWIR-2015 Total (kg)	ATWIR-2016 Total (kg)	Net Change (kg)
Complexing Agents

Grand Total	8.20E+05	9.00E+05	8.08E+04

Data Source: CID Data Versions D.14.00 (LANL-CO 2015a) and D.15.00 (LANL-CO 2016a). Note: This table only contains data for WIPP-bound waste streams at the TRU waste generator sites.

3.3 TRU Waste Radionuclide Estimates

This section presents the updated TRU waste radionuclide activity inventory collected from the TRU waste generator sites. The sites' waste stream radionuclide activities, shown in Table 3-8, Table 3-9, and Table 3-10, are decay-corrected through the end of CY 2015 (as described in section 2.2). Table 3-11 shows a comparison between ATWIR-2015 and ATWIR-2016 activity totals. The values in Table 3-11 are decay-corrected through the end of CY 2033 so that a comparison can be presented.

3.3.1 Radionuclide Inventory by Site

Table 3-8 and Table 3-9 provide the comprehensive WIPP-bound anticipated activity inventory estimates for CH- and RH-TRU waste, respectively. Table 3-10 sums the CH and RH site totals to produce a total anticipated activity by site.

Table 3-8. Total CH Radionuclide Activity (Ci) on a Site Basis Decayed through 2015

3.3.2 Radionuclide Changes

Radionuclide activity estimates improve as additional waste is characterized. Table 3-11 presents the changes in the total activity between the ATWIR-2015 and this report. For comparison, the activities reported in this table were decay-corrected to the common calendar year of 2033.

The net change column includes both increases and decreases as reported by the TRU waste generator sites and the WDS.

As shown in Table 3-11, the total anticipated CH- and RH-TRU waste activity reported by the sites has increased by 1.82 million Ci. The majority of this increase, 1.39 million Ci, is attributed to the addition of a projected waste stream, SR-KAC-PuOx, which represents the K-Area packaging of the projected 6 metric tons of Pu oxide.

There was a negligible decrease of 3,270 Ci for the activity emplaced at the WIPP and temporarily stored at WCS. This is a byproduct of an inventory methodology change for this report. Previously, the “emplaced” waste streams in the CID represented the WIPP above-ground and underground wastes, and WCS waste combined. To report the WCS activity separately from the WIPP emplaced activity, a new query was obtained from the WDS administrators which segregated the WCS activities. These activities were decay-corrected as a

combined set, and documented in analysis report INV-SAR-36, *Calculations for WCS Inventory - 2014* (Van Soest 2015). The resulting activity was then deducted from the total of the CID “emplaced” waste streams for publication in the ATWIR-2015.

This year, the WCS and WIPP above-ground wastes were segregated into separate waste streams from their WIPP underground counterparts, and imported to the CID for normal inventory processing. This task was documented in INV-SAR-39, *WDS Data Transformation for Insertion in the 2015 Inventory CID Import Template* (Van Soest 2016). This change resulted in the assignment of earlier assay years used as a basis for decay for each affected WIPP underground waste stream. Following the decay-correction through CY 2033, described in section 2.2.3, the WCS waste stream activities were tallied separately from the WIPP above-ground and underground waste stream activities. The earlier basis assay years for the underground waste streams necessitated a longer decay term to CY 2033, thus decreasing the resulting activity.

Table 3-11. CH/RH Activity Changes Decayed through 2033

TRU Waste Generator Site	ATWIR-2015 Total (Ci)	ATWIR-2016 Total (Ci)	Net Change (Ci)

4.0 POTENTIAL TRU WASTE

As described in section 2.1, a waste stream is designated either WIPP-bound or potential. Approximately 9% of the final form TRU waste volume reported by the TRU waste generator sites during this year’s data collection was identified as potential TRU waste. While a site may designate waste streams as potential for many different reasons, it is usually because of regulatory or physical constraints, such as the lack of characterization data.

DOE/CBFO has listed the criteria for categorizing waste streams as potential and these are described in Appendix D (Patterson 2010). Below are the categories for which TRU waste generator sites would consider a waste stream to be potential TRU waste.

- TRU Determination – Waste that is categorized as “undetermined” will remain potential until the waste stream is officially determined to be TRU. If the waste stream is determined to be non-TRU, it will be removed from the inventory.
- Defense Determination – WIPP can only accept TRU waste resulting from defense-related activities, as stated in the WIPP LWA (U.S. Congress 1992 and 1996). Waste that has an “unknown” defense determination will remain potential until the waste stream is officially determined to be defense waste. If the waste stream is determined to be non-defense, it will be removed from the inventory.
- Regulatory Restrictions – There are numerous regulatory restrictions that would prevent waste in its current form from coming to WIPP. Examples include limits on curies and dose rates on RH canisters, limits for total emplacement curies on RH waste, prohibited Resource Conservation and Recovery Act hazardous waste, etc. Sites must treat, repackage, or remove any restricted items before such waste can be accepted for disposal at WIPP.
- Incomplete Data – Waste that has missing or incomplete data, such as radionuclide activities, WMP mass, final form container data, or unknown waste stream information, is deemed potential until required data are obtained.
- Directed by DOE to Move to Potential – Waste will be moved to potential at the direction of DOE.

Table 4-1 identifies the current potential CH- and RH-TRU waste streams. All values discussed in this section are presented to three significant figures.

¹See Figure 1-1 for site designators. Sites with potential TRU Waste Only are: WV, RP, and BL. Data Source: CID Data Version D.15.00 (LANL-CO 2016a).

Waste streams categorized as potential may become eligible for disposal at WIPP if all requirements, as noted above, are met and the waste meets all WIPP requirements (e.g., WIPP WAC and WAP). As shown in Table 4-2, one potential waste stream from LANL was reassigned to a WIPP-bound waste stream during CY 2015.

Waste Stream ID ¹	Reason
LA-LAMHD02238	Added new radionuclide data

¹See Figure 1-1 for site designators; Data Source: CID Data Version D.15.00 (LANL-CO 2016a).

5.0 SUMMARY

Waste receipt and emplacement operations are still suspended since the occurrence of the two events in February 2014; therefore, no shipments were received and no waste was emplaced during CY 2015.

This report is an update to the data found in the ATWIR-2015 (DOE 2015a) and focuses on data changes resulting from characterization, improved estimations, and continued waste generation at the TRU waste generator sites. This report provides the most current TRU waste inventory

information available to DOE/CBFO, the DOE complex, WIPP stakeholders, and regulators, as of December 31, 2015.

As a result of the events in February 2014 at WIPP, a small volume of TRU waste continues to be temporarily stored at WCS during CY 2015. Even though WIPP is shut down, the TRU waste generator sites continue to characterize and certify TRU waste, using the existing certification program, and are building a backlog of waste ready for shipment.

TRU waste generator sites continue to report better inventory estimates using known characterization data for their stored and projected waste. The most significant changes in this update are due to adding 32 new waste streams, reporting over 2,200 containers that had been inadvertently left out by the generator site, reporting estimated projections through 2050, and identifying increases in projected waste.

6.0 GLOSSARY

Acceptable Knowledge – Any information about the process used to generate waste, material inputs to the process, and the time period during which the waste was generated, as well as data resulting from the analysis of waste, conducted prior to or separate from the waste certification process.

Anticipated Inventory – The sum of the total stored and total projected inventory reported by the TRU waste generator sites.

Assay Year – The most recent year in which the containers in a waste stream were assayed. For waste streams containing only projected waste, the initial projected generation year is used. This “base” year for the waste stream is used for decay and buildup calculations to normalize the radionuclide inventory across the complex to a common year for reporting.

Complexing Agents – Organic molecules that are capable of binding to metals. These organic molecules include, but are not limited to, acetate, citrate, oxalate, and EDTA.

Contact-Handled TRU Waste – Packaged TRU waste with an external surface dose rate not greater than 200 millirem per hour.

Current Form Waste – The chemical and physical state and packaging configuration of waste when it is generated and as it is currently being stored on site.

Defense Waste – (1) Radioactive waste from any activity performed in whole or in part in support of DOE atomic energy defense activities. Excludes waste under the purview of the Nuclear Regulatory Commission or generated by the commercial nuclear power industry. (2) Nuclear waste derived mostly from the manufacture of nuclear weapons, weapons-related research programs, the operation of naval reactors, and the decontamination of nuclear weapons production facilities.

Depleted Waste Stream – An existing waste stream from which all containers have been dispositioned. Waste containers from other waste streams that fit the waste stream description may be added back into a depleted waste stream, thus converting it to active status.

Disposal – Emplacement of waste in a manner that assures isolation from the biosphere for the foreseeable future with no intent of retrieval and that requires deliberate action to regain access to the waste.

Emplaced Inventory – Waste that is in above ground storage or disposed underground at the WIPP.

Final Form Waste – Form of waste in packaging approved for shipment and emplacement at the WIPP.

Land Withdrawal Act – The 1992 legislation passed by the U.S. Congress as Public Law 102-579, withdrawing the surface land and underlying minerals at the WIPP site from public use, transferring the property from the Bureau of Land Management to DOE, and enabling the start of the WIPP Test Phase. This act was amended in 1996 by Public Law 104-201.

Oxyanions – Negatively-charged ionic species containing oxygen, such as sulfate, nitrate and phosphate.

Packaging Material – A non-radiological material (such as steel, plastic, cellulose, rubber and lead) used as components of the WIPP-approved containers which hold TRU waste.

Performance Assessment – PA is an analysis that: (1) identifies the processes and events that might affect the disposal system; (2) examines the effects of these processes and events on the performance of the disposal system; and (3) estimates the cumulative releases of radionuclides, considering the associated uncertainties, caused by all significant processes and events. These estimates are incorporated into an overall probability distribution of cumulative release to the extent practicable.

Potential Inventory – For this report, a designation for a waste stream that will not be included in PA calculations. This designation is not intended to identify whether the waste stream may or may not be emplaced at WIPP.

Projected Inventory – That part of the inventory that has not been generated (does not physically exist) but is estimated to be generated at some time in the future by the TRU waste generator sites (only TRU waste projected to be generated through CY 2033 is presented in this report). TRU waste in projected waste streams includes waste from programs that have not come on line as of the cutoff date for this report, as well as waste from ongoing projects and D&D waste that has not yet been packaged.

Radioactive – Term used to refer to an unstable atomic nucleus that decays with the spontaneous emission of ionizing radiation (see also “radionuclide”).

Radionuclide – (1) A species of atom having an unstable nucleus that is subject to spontaneous decay or disintegration and usually accompanied by the emission of ionizing radiation. (2) Any nuclide that emits radiation. A nuclide is a species of atom characterized by the constitution of its nucleus and hence by the number of protons, the number of neutrons, and the energy content.

Remote-Handled TRU Waste – Packaged TRU waste with an external surface dose rate equal to or exceeding 200 millirem per hour.

Stored Inventory – That part of the TRU waste inventory that currently exists (already generated, but not yet shipped) as of the data cutoff date. Stored inventory can be “current form waste” or “final form waste.”

Transuranic – Pertaining to elements that have atomic numbers greater than 92, including neptunium, plutonium, americium, and curium. All are radioactive, are not naturally occurring, and are members of the actinide group.

Transuranic Waste – The LWA definition of transuranic waste is: Transuranic waste is radioactive waste containing more than 100 nanocuries (3,700 becquerels) of alpha-emitting transuranic isotopes per gram of waste, with half-lives greater than 20 years, except for: (1) high-level radioactive waste; (2) waste that the Secretary of Energy has determined, with the concurrence of the Administration of the Environmental Protection Agency, does not need the degree of isolation required by 40 Code of Federal Regulations (CFR) Part 191 disposal regulations; (3) waste that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR Part 61.

TRU Waste Generator Sites – The five major active DOE facilities and several smaller sites throughout the United States that generate and store TRU waste. These may be referred to as “sites.”

Waste Acceptance Criteria – The criteria used to determine if waste is acceptable for disposal at WIPP.

Waste Control Specialists, LLC – WCS, located in Andrews County, Texas, is a licensed radioactive waste disposal facility. Currently, transuranic waste destined for WIPP, is temporarily stored there until WIPP reopens.

Waste Form – The physical form of the waste, such as sludges, combustibles, metals.

Waste Isolation Pilot Plant– The project authorized under section 213 of the DOE National Security and Military Applications of Nuclear Energy Authorization Act of 1980 (U.S. Congress 1979) to demonstrate the safe and environmentally-sound disposal of radioactive waste materials generated by atomic energy defense activities.

Waste Material Parameter– A non-radiological material that is found in TRU waste (e.g., CPR materials are monitored as contributors to the generation of gas at WIPP).

Waste Stream – Waste material generated from a single process or from an activity that is similar in material, physical form, and hazardous constituents.

Waste Stream Profile – A description of a CH- or RH-TRU waste stream that is designated as WIPP-bound or potential. The waste profile is presented in tabular format and is intended to provide a summary of the important information about a particular waste stream.

WIPP-bound Inventory – For this report, the designation for a waste stream that will be included in PA calculations. This designation is not intended to identify whether or not the waste stream will be emplaced at WIPP.

APPENDIX A WIPP-BOUND TRU WASTE PROFILE REPORTS

The following waste profile reports contain information on waste streams that are placed in the WIPP-bound category as of the inventory date, December 31, 2015.

The TRU waste generator sites that have reported WIPP-bound waste streams are:

AE	Argonne National Laboratory
AW	Material and Fuels Complex
BT	Bettis Atomic Power Laboratory
IN	Idaho National Laboratory
KA	Knolls Atomic Power Laboratory - Schenectady
KN	Knolls Atomic Power Laboratory - Nuclear Fuel Services
LA	Los Alamos National Laboratory
LB	Lawrence Berkeley National Laboratory
LL	Lawrence Livermore National Laboratory
ND	Nuclear Radiation Development Site
NT	Nevada National Security Site
OR	Oak Ridge National Laboratory
RL	Hanford (Richland) Site
SA	Sandia National Laboratories
SP	Separations Process Research Unit
SR	Savannah River Site

Waste Stream ID: **AE-T001**

Waste Stream Description

The debris waste consists primarily of organic and inorganic laboratory debris. Organic debris materials includes paper, cardboard, cloth, plastic, and rubber. Inorganic debris materials include aluminum items, glass, tools, lead (e.g., scrap, shielding), metal cans, scrap metal, and laboratory equipment.

Waste Stream Description

Waste stream consists of RH TRU debris generated by destructive and nondestructive examination of radiological materials such as fuel pins, reactor structural materials, and targets in waste cans. This waste stream consists predominantly of organic and inorganic debris generated during the destructive and nondestructive examinations. Wastes are visually inspected at packaging to ensure that the waste is compliant per the ANL Acceptable Knowledge document.

Waste Stream ID: **AW-5410N**

Waste Stream Description

This waste generated at the Rocky Flats Plant includes ash heels and soot from the plutonium recovery incinerator. The ash heels consist of insoluble materials from dissolution of plutonium-containing materials. Soot is the airborne fly ash that accumulated in the off-gas system of the plutonium recovery.

Waste Stream ID: **IN-BN425**

Waste Stream Description

This waste stream consists of spent anionic and cationic exchange resins used in the plutonium and americium purification and recovery processes at Rocky Flats.

Waste Stream ID: **IN-BN501**

Waste Stream Description

Soil generated in the retrieval process may be generated from the removal of overburden and/or interstitial soil between containers of waste or as a result of spill cleanup or packaged soil from a breached soil waste container during segregation of soils identified during sorting in the boxlines. activities. It also may include soils generated by AMWTP as a result of repackaging loose soil from breached containers that is suspected to being PCB contaminated. Waste may include repackaged or intact containers of historically stored soils with insufficient AK information to assign a legacy IDC. The waste may also contain or be commingled with homogeneous solids or debris waste.

Waste Stream ID: **IN-BN505**

Waste Stream Description

Loose or cross-contaminated inorganic homogeneous solids derived from historically stored waste (e.g., sludge's, salts, ash, heels, special setups, or other process residual solids including absorbents) from WIPP acceptable generators RF, MD, AE, SD, ID, and AW. Also may include inorganic homogeneous solids generated by AMWTP as a result of repackaging loose homogeneous solids from breached containers. Waste may include repackaged or intact containers of historically stored inorganic homogeneous solids waste with insufficient AK information to assign a legacy IDC.

Waste Stream Description

BN510.4 waste stream is debris waste from multiple debris waste feedstock sources that has been supercompacted into pucks and packaged into 100-gallon drums.

Waste Stream ID: **IN-BN511**

Waste Stream Description

Loose or cross-contaminated organic homogeneous solids derived from historically stored waste (e.g., organic setups IDCs RF-003 or RF-743). This may include organic homogeneous solids generated by the AMWTP as a result of repackaging loose homogeneous solids from breached containers that are suspected of being PCB contaminated. It also includes repackaged or intact containers of historically stored homogeneous solids waste with insufficient AK information to assign a legacy IDC.

Waste Stream ID: **IN-BN513**

Waste Stream Description

Inorganic homogeneous solids generated in WMF-676 that is directly related to the Supercompactor operations from processing containers assigned IDCs listed in RPT-TRUW-83 as approved feedstock. The waste consists of dust buildup material on the 1st floor and a mixture of paint flakes, solid waste, and dried squeezants material at the Supercompactor. Solids are also generated as metal oxides from plasma cutting operations and collected during cleanup of the Brokk pedestal area.

Waste Stream ID: **IN-BN517**

Waste Stream Description

Soil generated in the retrieval process may be generated from the removal of overburden and/or interstitial soil between containers of waste or as a result of spill cleanup or packaged soil from a breached soil waste container during segregation of soils identified during sorting in the boxlines. activities. It also may include soils generated by AMWTP as a result of repackaging loose soil from breached containers. Waste may include repackaged or intact containers of historically stored soils with insufficient AK information to assign a legacy IDC. The waste may also contain or be commingled with homogeneous solids or debris waste.

Waste Stream ID: **IN-BN525**

Waste Stream Description

Heterogeneous PCB debris waste generated by AMWTP during handling of TSCA PCB-contaminated waste or waste that contains PCB items other than PCB debris waste generated in WMF-676. Waste also includes loose debris that is PCB-contaminated or commingled with other PCB waste and debris generated during the cleanup of spills or leaks from waste containers that are PCB waste or are suspected to be PCB-contaminated or contain PCB items (e.g., SDA IDCs). The waste may also include intact containers of debris known or suspected to be commingled with PCB waste.

Waste Stream Description

This waste stream consists of drums containing Mound cemented sludge. The sludge was originally generated from the treatment of alpha-contaminated wastewaters at the Waste Disposal Building. The sludge was solidified with Portland Cement. Florco, a non-hazardous absorbent, may have been also added to the waste stream.

Waste Stream ID: **IN-BN842**

Waste Stream Description

This waste stream consists of predominantly inorganic waste materials generated during sectioning of fuel elements, grinding, mounting and polishing of metallographic specimens solidified in concrete matrix and placed in IN-41 containers (5 in dia. x16 in long). Thirteen of these IN-41 containers were shipped from BAPL to ANL-W where IN-41 containers were placed in HFEF-5 canisters (6 ft. tall x 12 in dia.). The HFEF-5 canisters were sent to RWMC for interim storage in 1988. The HFEF canisters were retrieved and repackaged into 4-55 gallon drums for characterization and shipment to WIPP.

Waste Stream ID: **IN-ID-EBR-S5000**

Waste Stream Description

This waste stream consists of one drum that contains sample holder, Nalgene bottles, sample solution absorbed in vermiculite and debris from analytical laboratory.

Waste Stream ID: **IN-ID-RF-S3114**

Waste Stream Description

This waste stream consists of one container of debris waste. This drum contains small volume of curium oxide cross section samples packaged in 1973 and sent to RWMC for interim storage. This drum was retrieved by AMWTP in 2009 and was sent to INTEC for characterization as suspect RH TRU Waste

Waste Stream ID: **IN-NRF-SPC-103**

Waste Stream Description

This waste stream was generated at NNPP facilities and consists of 108 containers in storage at the INL. Waste was generated during the same or similar process that generated the SPC waste. AK information is being collected to assure the waste stream meets WIPP requirements. Waste stream includes debris waste generated during analysis of post-irradiated nuclear fuel from Naval Reactors programs using destructive examination methods.

Waste Stream ID: **IN-W347**

Waste Stream Description

This waste is non-hazardous soil and debris from Building 234 decommissioning. The majority of the waste to be generated, estimated 90%, will be soil. All process equipment and glove boxes were removed in the early 1990s and are not part of this waste stream. The remaining debris consists of concrete block, metal, PPE, plywood, plexiglass, plastic, HEPA filters, piping, duct work, glass, cheese cloth, paper, rubber and small tools.

Waste Stream Description

Cement paste solidified aqueous waste and cemented sludge generated from facility and equipment operations and maintenance. Sludge is a residue from numerous treatment and filtration operations, involving aqueous liquid radioactive waste, that produces thin alkaline sludge (~25% solids) compatible with Portland cement. Final cemented waste monoliths are produced by mixing waste in 55-GAL steel drums containing empirically determined quantities of sludge, Portland cement, vermiculite, and sodium silicate.

Waste Stream ID: **LA-TA-03-30**

Waste Stream Description

Cemented Wastewater Treatment Sludge Solidified aqueous waste generated from facility and equipment operations and maintenance. Solidified aqueous waste is a dewatered sludge generated by the vacuum filtration of solids from treated aqueous waste slurry. The filter media (diatomaceous earth) with the entrapped filtrate is then placed in drums with dry concreted absorbent.

Waste Stream ID: LA-TA-21-15

Waste Stream Description

Non-combustible and combustible waste generated from facility and equipment operations and maintenance. This waste includes, but may not be limited to non-combustible solids and may also contain a smaller fraction of combustible solids and a small fraction of homogeneous solids.

Waste Stream ID: LA-TA-55-38

Waste Stream Description

Cemented Inorganics and Spent Samples Solidified inorganic process solids generated from facility and equipment operations and maintenance. This waste includes process leached solids, ash, filter cakes, salts, metal oxides, fines, evaporator bottoms, and sample residues (received from the CMR building) stabilized in Portland or gypsum cement.

Waste Stream ID: **LA-TRU-Empty-110**

Waste Stream Description

Specific waste items in this waste stream may include paper cartons, cardboard, Kimwipes, cotton swabs, tissues, cheesecloth, grinding paper, plastic (e.g., bags, sheet, tape, containers, pipette tips, and glovebox windows), Neoprene and Hypalon gloves (leaded and non-leaded), aluminum foil, tin cans, hardware (e.g., nuts, bolts, washers, fittings, gauges, fixtures, thermocouples), metal tools (e.g., screwdrivers and pliers), metal parts, equipment (with or without circuit boards), copper (wire, tubing, flanges, rods, and molds), sealed sources, aerosol cans, glass (e.g., beakers, vials, and ion exchange columns with resin), graphite molds, crucibles (magnesium oxide, tantalum), epoxy resin chunks, lead metal (e.g., bricks, foil), Kaufman cans (lead seams), lead-lined and cadmium-lined steel cans, mercury batteries, fluorescent and incandescent light bulbs, and small quantities of pyrochemical salts and solidified aqueous or organic liquids (individual drums contain less than 50 percent, by volume, solidified liquids, and/or salts).

Waste Stream Description

The waste consists primarily of used chloride and fluoride salts from pyrochemical processes such as electrorefining, molten salt extraction, and direct oxide reduction. There may also be up to 20% heterogeneous organic glovebox bagout waste packaged with the salt waste. This waste does not contain any RCRA listed hazardous materials.

Waste Stream Description

This waste stream is composed primarily of objects which, because of physical size, cannot be packaged in a 55-gallon drum. Typical objects include decommissioned gloveboxes, hoods, and large pieces of equipment (lathes, mills, etc.). This waste stream may contain lead metal (e.g., bricks, foil), Kaufman cans (lead seams), lead-lined and cadmium-lined steel cans, mercury batteries, fluorescent and incandescent light bulbs. The void space in boxes may be filled with other TRU waste items or with foam in plastic bags.

Waste Stream ID: LL-W018-SS

Waste Stream Description

AmO2 Bagout- Material generated from the production of ionization sources containing Am-241. Material consists mainly of consumable items used in the production gloveboxes (e.g. tissues paper towels, graphite blocks) but also includes equipment and tools that have exceeded their useful life. Most material is contained in one gallon cans that are placed into fifty five gallon drums. Silver Bagout- Material is mainly a vitrified slag that is created during the recovery of precious metals from scrap Am-241 foil. Also contained are items used in the glovebox during the recovery process (e.g. plastic bags, Carbon/Graphite crucibles, paper towels, induction furnaces).

Waste Stream Description

The two steel vessels are 1-inch thick by 3-foot diameter, weighing about 3300 lbs. each. The vessels contain heterogeneous mixtures of the following materials: Plutonium, D-38, Beryllium metal, Completely burned high explosive, Stainless steel, Brass, Polystyrene foam, Aluminum, Coke (degassed coal), Water absorbed by the coke, Steel, Glass, Epoxy resin, Thermalite (aerated cement block), Plaster, Hortag (fly-ash and clay), Wood, and Krypton-85 tracer gas for leak detection. The UK has had similar vessels in storage for over ten years, but none containing plutonium have ever been opened. Vessels containing D-38 only have been opened, with small amounts of water vapor and some loose debris found inside. The bulk of the materials were found to be trapped within the thick coke layer lining the inner surface of the vessel. No more wastes of this type are planned to be generated.

Waste Stream Description

The 105-KE RH waste stream is composed solely of cartridge-type water filters from the Primary Recirculation System. The waste stream includes water filters, accumulated waste and associated packaging. Other 100 area drums contain both combustible and noncombustible waste items. Combustible waste may include wood, plastics, paper, and rags. Noncombustible waste items may include metals, glass, concrete, and absorbed liquids. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters. The waste stream ranges from contaminated clothing to process equipment. The waste is generated from Reactor Facility/Equipment Operation and Maintenance Waste activities.

Waste Stream Description

Soil contaminated with large quantities of plutonium, americium, organics, and neutralized acid waste solutions that were removed from the 216-Z-9 Crib. Original packaging material (e.g., 10-L stainless steel slip-lid cans, plastic bags, and vermiculite) now waste due to deterioration and TRU contamination.

Waste Stream ID: **RL221U-03**

Waste Stream Description

Typically, drums contain both combustible and noncombustible waste items. Combustible waste may include wood, plastics, paper, and rags. Noncombustible waste items may include metals, glass, concrete, and absorbed liquids. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters.

Waste Stream ID: **RL308-01**

Waste Stream Description

Waste materials consist of absorbed liquids, including oils or hydraulic fluids, and inorganic debris (such as iron-based metal containers). Materials associated with waste packaging include plastic liners and various absorbents (including Cleanup-IV, Nochar A610, vermiculite, diatomaceous earth, and Radsorb). A limited amount of debris waste materials (glassware, rags, wipes, etc.) may also be present in the containers.

Waste Stream Description

Debris waste stream containing waste materials associated with the 325 Bldg. laboratory operations, sample analysis, facility cleanout, and facility waste treatment. Operations waste includes any discarded item used in laboratory analysis (e.g., glass beakers, tweezers, latex gloves, plastic tape, glass pipettes) and facility cleanout (e.g., glassware, wipes, and equipment). Maintenance waste may include filters, wipes, and various types of gloves. Small amounts of solid sample residues (unused samples) generated during lab operations are present in the waste.

Waste Stream Description

The mixed solid inorganic portion of the 325 waste stream from liquid laboratory samples neutralized and solidified using nonhazardous absorbents. Small amounts of neutralized and solidified liquids from hazardous waste treatment may also be present in the waste. Corrosive liquids, such as hydrochloric acid and sodium hydroxide were neutralized and solidified in cement before being packaged as waste.

Waste Stream ID: **RL325-08**

Waste Stream Description

Typically, drums contain both combustible and noncombustible waste items. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters. The waste is generated from R&D/R&D Laboratory Waste activities at the RADIOCHEMISTRY BUILDING.

Waste Stream Description

Waste materials consist of absorbed liquids, including oils or hydraulic fluids, and inorganic debris (such as iron-based metal containers). Materials associated with waste packaging include plastic liners and various absorbents (including Cleanup-IV, Nochar A610, vermiculite, diatomaceous earth, and Radsorb). A limited amount of debris waste materials (glassware, rags, wipes, etc.) may also be present in the containers.

Waste Stream Description

Typically, drums contain metals. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters.

Waste Stream ID: **RLBET-08**

Waste Stream Description

The CFFD (KM) waste stream consists of heterogeneous debris waste generated at the Cimarron Plutonium Fuel Fabrication Facility, operated by the Kerr-McGee Nuclear Corporation. This facility was a MOX fuel fabrication facility. The waste was generated during D&D activities at the facility. The waste includes typical D&D waste, e.g., paper, plastic, leaded rubber gloves, rags, glass, equipment, disassembled gloveboxes, and HEPA filters.

Waste Stream Description

RLETECD waste is composed of heterogeneous debris consisting of organic and inorganic debris material generated from glove box operations at the Energy Technology Engineering Center. Examples of waste items in this waste stream include cardboard tubes, cladding material, plastic, paper, glove port flanges, rubber air hoses, electrical connectors, wooden broom handles, plexiglas windows, steel plates, glove box ventilation piping and valves, lead, stainless steel, nickel-cadmium batteries, paint brushes and rollers, full-face respirators, sphincter cans, tools, copper, poly bottles, shoe covers, aluminum, vermiculite, soda ash, mixer components, glass, rags, molybdenum plates, drying ovens, MOX ash, gloves, fittings, gas line hookups, balance weights, cloth, pumps, castings, small quantities of neutralized/solidified liquids, and concrete.

Waste Stream Description

Typically, drums contain both combustible and noncombustible waste items. Combustible waste may include wood, plastics, paper, and rags. Noncombustible waste items may include metals, glass, concrete, and absorbed liquids. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters. The waste is generated from R&D/R&D Laboratory Waste activities at the Rockwell International, Energy Systems Group (CA).

Waste Stream Description

RLEXXOD waste is comprised of heterogeneous debris consisting of organic and inorganic debris material generated from processing, cleanout, and D&D of the Mixed Oxide Fuel Fabrication Plant. Examples of waste items in this waste stream include unirradiated MOX fuel pellets, MOX powder and scrap, cladding material, MOX standards, plastic, paper, gloves and glove rings, filters, cans, HEPA filters, cardboard, electrical components, tools, scales and scale parts, screens, paint brushes, bags, floor sweepings, pots and pans, tool boxes, steel plates and racks, grinder parts, pellet trays, conduit pipe, motors, filter and vacuum hoses, and rags.

Waste Stream Description

Combustible and noncombustible RH-TRU debris waste retrieved from the Hanford low-level burial grounds that cannot be identified or assigned to an original generator. Combustible waste may include wood, plastics, paper, absorbents, rubber, and rags. Noncombustible waste may include failed machinery, tools, glass, concrete, plumbing, and fixtures.

Waste Stream Description

Typically, drums contain both combustible and noncombustible waste items. Combustible waste may include wood, plastics, paper, and rags. Noncombustible waste items may include metals, glass, concrete, and absorbed liquids. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters.

Waste Stream Description

200 Areas (F and H Separations Facilities). This waste is primarily solids consisting of mainly booties, lab coats, floor sweepings, rags, labware, and other job control wastes. Small HEPAs, liquids, sludges and resins may also be found in this stream. The waste is generated primarily through separation activities in the course of plutonium production, includes small amounts of TRU waste from on site laboratories.

Waste Stream ID: SR-W026-221F-HET-A

Waste Stream Description

This waste stream is defense related debris consisting of large equipment and job control waste packaged in large steel boxes

APPENDIX B POTENTIAL TRU WASTE PROFILE REPORTS

The following waste profile reports contain information on potential TRU waste streams as of the inventory date, December 31, 2015. These waste streams were placed in the potential category for various reasons as stated in section 4.0 of this report.

The TRU waste generator sites that have reported potential TRU waste streams are:

AW	Material and Fuels Complex
BL	Babcock and Wilcox Nuclear Energy Services
IN	Idaho National Laboratory
LA	Los Alamos National Laboratory
RL	Hanford (Richland) Site
RP	Hanford Site – Office of River Protection
WV	West Valley Demonstration Project

Waste Stream ID: **BL-Parks**

Waste Stream Description

Oversized waste items are removed from the boxline processing of feedstock debris. Oversized waste items identified in the hot maintenance cell and the boxlines as not conducive to size reduction are repackaged in boxes and removed from the facility. Oversized debris waste items include only those IDCs identified in RPT-TRUW-83 that are authorized as feed to the Supercompactor.

Waste Stream Description

This waste stream consists of drums of debris waste that were returned to the AMWTP from the Idaho Nuclear Technology and Engineering Center (INTEC) after characterization. The drums were opened to determine if contents were contact-handled (CH) or remote-handled (RH), remediated WIPP-prohibited items if necessary and finally repackaged in the appropriate configuration for RH or CH waste. The CH portion of this waste was returned to the AMWTP for further characterization and shipment to WIPP.

Waste Stream Description

The liquid SBW would be transferred from the storage tanks to the steam reforming process over a 2.0-year period. The steam reforming process is a fluidized bed reactor that converts the metals dissolved in the nitric acid into a dry granular powder. The fluidized bed operates at temperature between 600 and 1000 degrees centigrade. The carbonate waste form would be removed from the fluidized bed and transferred to the canning facility and placed by 96% loading in to 72-B canisters (direct loaded). The carbonate waste form would be RH-TRU waste, dried to 1% moisture, and would generate approximately 1100 canisters with a surface dose rate <100 Rem/hr.

Waste Stream ID: **IN-SBW-01B**

Waste Stream Description

Typically, drums contain both combustible and noncombustible waste items. Combustible waste may include wood, plastics, paper, and rags. Noncombustible waste items may include metals, glass, concrete, and absorbed liquids. If present, boxes typically contain larger waste items (e.g., whole or sectioned glove boxes, ducting, and process vessels). Both drums and boxes may be used for disposal of high-efficiency particulate air filters.

Waste Stream ID: **RLCH2-08**

Codes Provided**

Waste Stream Description

This waste stream consists of RCRA hazardous liquid waste with associated fissile material generated from decontamination and decommissioning activities.

Waste Stream ID: **WV-Z001**

Appendix B
Waste Profile Report

Codes Provided

Waste Stream Description

Debris waste buried on-site during original plant processing operations

APPENDIX C HISTORIC CROSSWALK OF WASTE STREAMS

From one release of the ATWIR report to the next, waste streams may undergo reorganization by the TRU waste generator sites. Waste streams may be renamed, divided, consolidated, created, or removed from the inventory altogether (i.e., shipped to WIPP or reclassified as low-level waste [LLW]). This appendix contains a crosswalk that maps current ATWIR-2016 TRU waste generator site waste streams to the ATWIR-2015 TRU waste generator site waste streams. This appendix does not include emplaced waste at the WIPP or waste temporarily stored at WCS.

Table C-1 displays the association of each ATWIR-2016 waste stream to its respective ATWIR-2015 waste stream(s). Waste streams that are newly reported in the ATWIR-2016 and that do not map to a previous waste stream from ATWIR-2015 are indicated as *New Waste Stream*.

Table C-2 shows the inverse of Table C-1. Table C-2 displays the association of each ATWIR-2015 waste stream to its respective ATWIR-2016 waste stream(s). Waste streams that were previously reported in the ATWIR-2015 and that do not map to a current ATWIR-2016 waste stream are indicated as *Depleted Waste Stream*, along with a reason.

APPENDIX D DOE POTENTIAL WASTE SCREENING MEMORANDUM

Department of Energy
Carlsbad Field Office
P. O. Box 3090
Carlsbad, New Mexico 88221
March 29, 2010

Mr. Ned Elkins, Manager
Los Alamos National Laboratory - Carlsbad Operations
115 N. Main
Carlsbad, NM 88220

Subject: TRU Waste Inventory Screening Criteria Guidance

Dear Mr. Elkins:

The Department of Energy Carlsbad Field Office (CBFO), in the enclosed memorandum, is providing guidance on the criteria to be used to screen transuranic (TRU) waste streams for exclusion from the Waste Isolation Pilot Plant (WIPP)-bound inventory in upcoming Annual TRU Waste Inventory Reports. This guidance will stay in effect until Los Alamos National Laboratory – Carlsbad Operations is formally notified otherwise by CBFO.

If you have any questions regarding this guidance please notify me at (575) 234-7457.

Sincerely,

Russ Patterson
Compliance Certification Manager

Screening Memorandum
March 17, 2010

This screening memo describes criteria that will be used to screen transuranic (TRU) waste streams for exclusion from the Waste Isolation Pilot Plant (WIPP)-bound inventory. This WIPP-bound waste is used in future performance assessments (PAs) for the Compliance Recertification Application (CRA). This memo does not address high level, low level or commercial waste since they are prohibited for disposal in WIPP. The table below contains screening criteria that will be used to designate Potential waste streams. The table in no way indicates that waste identified as Potential will be excluded from emplacement in WIPP in the future.

All waste streams collected for each Annual TRU Waste Inventory Report (ATWIR) are categorized within the TRU waste inventory database as WIPP-Bound unless one or more of the screening criteria listed in the table below are encountered. All shipments to WIPP will be subject to the conditions delineated in the WIPP Hazardous Waste Facility Permit Waste Analysis Plan (WAP), WIPP Waste Acceptance Criteria (WAC) and the Transuranic Authorized Methods for Payload Control (TRAMPAC). The table below is intended to be treated as a guide for delineating Potential waste streams that will be reported in the ATWIR in Appendix C and excluded from being reported in Performance Assessment Inventory Report (PAIR) that will be used for future PAs.

Criteria for Categorizing Waste Streams as Potential

Screening Criteria	Comment
TRU Determination Undetermined	Will remain potential until the waste stream has been officially determined to be transuranic. If the waste stream is determined to be non-transuranic then it will be removed from the inventory.
Defense Determination Unknown	Will remain potential until the waste stream has been officially determined to be defense waste. If the waste stream is determined to be non-defense then it will be removed from the inventory.
Regulatory Restrictions <ul style="list-style-type: none"> • Surface Dose > 1000 R/hr • Activity >23 Ci/L (or 23,000 Ci/m³) averaged over the volume of the canister • Prohibited hazardous constituents • Summary category groups other than S3000, S4000, S5000 • And other regulatory restrictions 	Will remain potential until the waste stream meets all acceptance criteria for WIPP. This may involve: <ul style="list-style-type: none"> • Repackaging waste stream • Treating waste stream • Removal of restricted items from waste stream • Any other process that would remediate the regulatory restriction
Incomplete Data <ul style="list-style-type: none"> • Incomplete or missing radionuclide concentrations • Incomplete or missing WMP 	Will remain potential until the waste stream reports all required data.

Screening Criteria	Comment
densities <ul style="list-style-type: none"> • Incomplete or missing final form container information • Unknown waste stream information • Any other incomplete or missing waste stream information that is required for PA 	
Directed by DOE to move to Potential	Will remain potential until DOE directs to remove waste stream from potential.
