Introduction

Goal 1: Launch desalination technologies that deliver cost-competitive clean water

Goal 2: Transform the energy sector’s produced water from a waste to a resource

Goal 3: Achieve near-zero water impact for new thermoelectric power plants, and significantly lower freshwater use intensity within the existing fleet

Goal 4: Double resource recovery from municipal wastewater

Goal 5: Develop small, modular energy-water systems for urban, rural, tribal, national security, and disaster response settings

Cross-Cutting

Q/A
INTRODUCTION
What is a Grand Challenge?

A Grand Challenge is a big, difficult problem that, if solved, would bring significant benefits to society. Grand Challenges often include the following important characteristics:

- Feature a measurable end-point that is highly ambitious but achievable
- Drive the need for collaboration between multiple disciplines, some of which do not normally interact
- Are too big to be undertaken by one or even a few organizations
- Capture the imagination of the public, thereby facilitating strong support for the resources required to achieve the goals

Characteristics adapted from NNI Grand Challenge FAQs [http://www.nano.gov/node/1522](http://www.nano.gov/node/1522)
The Water Security Grand Challenge

Advance transformational technology and innovation to meet the global need for safe, secure, and affordable water. By 2030:

- Launch desalination technologies that deliver cost-competitive clean water.
- Transform the energy sector’s produced water from a waste to a resource.
- Achieve near-zero water impact for new thermoelectric power plants, and significantly lower freshwater use intensity within the existing fleet.
- Double resource recovery from municipal wastewater.
- Develop small, modular energy-water systems for urban, rural, tribal, national security, and disaster response settings.
Cross-cutting, interagency teams have been formed to:

- Develop new prize proposals
- Advance our understanding of key barriers and opportunities in each goal area
- Coordinate and inform future R&D and related activities
- Assemble and analyze relevant data
- Identify and pursue high-impact partnerships
- Track and coordinate communications opportunities

GOAL 1:
Launch desalination technologies that deliver cost-competitive clean water

Team Lead Presenter: Avi Shultz
**American-Made Challenge: Solar Desalination**

**Objective**: Demonstrate cost-effective solar thermal desalination technologies for specific markets and applications.

**What?**
- This prize is a series of contests designed to accelerate technology innovation through the design, development, and demonstration of desalination systems that use sun power to generate fresh water from salt water.
- The fresh water produced can be used for agriculture, industry, and for municipal supply.

**Prize Structure and Features:**
- The prize provides innovators a pathway from initial concept to technical design, to prototype, to field-tested systems that provide clean, accessible water using solar as the primary energy source.
- The prize will seek to connect technology innovators to potential customers and test facilities.

**Sample Metrics:**
- Thermal Efficiency ($\text{kWh}_{\text{thermal}}/\text{m}^3$ product water)
- Recovery Ratio ($V_{\text{product water}}/V_{\text{brine}}$)
- Continuous Operations (Continuous hours of water production)
- Solar Efficiency ($\text{kWh}_{\text{solar}}/\text{m}^3$ product water)
- Projected levelized cost of heat (LCOH) and water (LCOW)

GOAL 2:
Transform the energy sector’s produced water from a waste to a resource

Team Lead Presenter: Elena Melchert
OIL & GAS PRODUCED WATER SITUATIONAL ANALYSIS

DOE Energy Water Desal Hub
Early-stage R&D for treating salinity in non-traditional water sources

EPA Produced Water Study 2019
GWPC States Produced Water Report 2019
Chevron Prize $25K

WH/DOE Water Security Grand Challenges
Transform Produced Water from a Waste to a Resource

FY 2019 Produced Water Treatment Projects $4.5 million
OIL & GAS PRODUCED WATER RESEARCH PORTFOLIO
ALMOST 60 PROJECTS WITH A TOTAL VALUE OF OVER $100 MILLION

- Water management challenges and options are usually site and region specific.
- Partners include: state institutions, other federal agencies, national laboratories, universities, and the private sector.
- Research includes:
  - Wellbore integrity
  - Reducing freshwater use
  - Beneficial use of treated water

**URTeC: 2886718  Produced Water Treatment R&D:** Developing Advanced, Cost-Effective Treatment Technologies
Erica Folio, Olayinka Ogunsola, Ph.D., Elena Melchert, Evan Frye; U.S. Department of Energy, Office of Fossil Energy, Office of Oil and Natural Gas

**SYMPOSIUM:** Application of Solid-Liquid Separation Technologies for Treatment of Produced Water
Olayinka Ogunsola, Ph.D.
American Institute for Chemical Engineers, Pittsburgh Nov. 2018

MULTI-AGENCY MEMORANDUM OF AGREEMENT

SEAB 2011: hydraulic fracturing

- Water quality assessment
- Air monitoring and assessment
- Human health and environmental risk

- Monitoring and remediation technologies
- GHG and air emissions
- Air and water monitoring networks

- Ecosystem and environmental health studies
- Water quality monitoring
- Water availability

- Wellbore integrity, flow, and control
- Technology development
- System engineering, imaging, and materials

- Engineered natural system interactions
- Geologic models and analysis
- Nanotube characterization
- Reduced uncertainty

- Resource assessments
- Hydrology and geology; earthquake hazards
- Land use, wildlife, and ecological impact

MEMORANDUM
TO: Assistant Secretaries, National Laboratories
Department of Energy
Assistant Secretary, Bureau Directors
Department of the Interior
Assistant Administrators, Regional Administrators
Environmental Protection Agency
FROM: Ana Majumdar, Acting Under Secretary of Energy
Department of Energy
David J. Hayes, Deputy Secretary
Department of the Interior
Bob Perciasepe, Deputy Administrator
Environmental Protection Agency
SUBJECT: Multi-Agency Collaboration on Unconventional Oil and Gas Research

OVERVIEW: In March 2011, the White House released a “Blueprint for a Secure Energy Future” (Blueprint) - a comprehensive plan to reduce America’s oil dependence, save consumers money, and make our country the leader in clean energy industries. The Blueprint supports the responsible development of the Nation’s oil and natural gas, with the specific goals of promoting safe practices and reducing energy imports. The Department of Energy (DOE), the Department of the Interior (DOI), and the Environmental Protection Agency (EPA) each will have a critical role to play in this mission.

To this end, the DOE, DOI, and EPA will develop a multi-agency program directed toward a focused collaborative Federal interagency effort to address the highest priority challenges associated with safely and prudently developing unconventional shale gas and tight oil resources. The goal of this program will focus on timely, policy relevant science directed to research topics where collaboration among the three agencies can be most effectively and efficiently conducted to provide results and technologies that support sound policy decisions by state and Federal agencies responsible for ensuring the prudent development of energy sources while protecting human health and the environment. This program responds to the Blueprint and to relevant recommendations of the Secretary of Energy Advisory Board Subcommittee on Natural Gas.
GOAL 3:

Achieve near-zero water impact for new thermoelectric power plants, and significantly lower freshwater use intensity within the existing fleet

Team Lead Presenters: Robie Lewis, Madhav Acharya
Water scarcity, growing population

Growing population, increased thermoelectric water demand

Potential Areas of Concern benefitting from R&D

Growing population, increased thermoelectric water demand

National Relevance

- As planned thermoelectric power grows to keep up with demand, more effective water management may help maintain low operating costs and avoid increased water stress.

- In water constrained areas, thermoelectric power is looking to utilize technologies such as waterless plants employing dry cooling technologies to help alleviate current water stress.

Water Withdrawal by Generating Source/Cooling Type

Source: NREL/TP-6A20-50900
Water Consumption by Generating Source/Cooling Type

Source: NREL/TP-6A20-50900
**Promising Prize Topic from Workshop**

*Develop new cooling technologies that significantly reduce water use while maintaining/increasing thermal efficiencies and reducing parasitic loads*

- Are there new equipment designs that could provide more cost-effective heat transfer with lower water use?
- Possibilities could include combining the use of new geometries, materials, and coatings
- Innovations are possible in both wet or dry cooling

Cooling is the major water draw from within the power sector. Technologies do exist to reduce water in cooling applications, but come with an energy/cost penalty or have not been demonstrated at scale.

Opportunity to build on recent R&D investments by DOE programs to help reduce this penalty.
Recent R&D Activities

Within DOE –

- EERE-AMO: Materials in Harsh Environments, Additive Manufacturing
- ARPA-E: ARID Program for Dry Cooling
- FE: Water Management R&D; University Training Programs
  - University Training and Research for Fossil Energy Awards – Modeling Existing Coal Plant Challenges Using High-Performance Computing (CLOSED)

  - Crosscutting Research for Coal-Fueled Power Plants / Area of Interest 2B: Coal Power Plant Dry Cooling Technology (OPEN)
- NE: Ongoing Materials R&D, University R&D Solicitation, Integrated Hybrid Energy Systems
  - Fiscal Year 2019 Consolidated Innovative Nuclear Research (CLOSED)
  - Fiscal Year 2020 Consolidated Innovative Nuclear Research (OPEN)
- OP: Existing Plant Water Usage and Cooling System Selection Behavior
GOAL 4:
Double resource recovery from municipal wastewater

Team Lead Presenter: John Smegal
The Water Security Grand Challenge

Wastewater Resource Recovery Prize Competition

**Objective:** Scale resource recovery through local, systems-based solutions centered around small-to-medium sized wastewater treatment plants

**Why?**
- Resource recovery is currently taking place among the largest wastewater treatment plants. To achieve scale, need to target the next layer down.
- Recovery technologies exist, but creative, system-wide solutions that link resource providers with customers are in shorter supply.
- Prize will seek to draw out coalitions of partners that may not have taken the time to work together absent a financial incentive.

**Prize Structure and Features:**
- Two-phases: first, seeks to build library of creative solutions; second, focuses on more detailed and rigorous system design.
- Seeking alignment with public financing programs (e.g. WIFIA, SRF, USDA programs) to facilitate access to capital for successful designs.

**Sample Metrics:**
- Recovery rate (total resources recovered/total resources present in influent)
- Improvement rate (percent improvement from facility’s own baseline)

**Anticipated Phases**

GOAL 5:

Develop small, modular energy-water systems for urban, rural, tribal, national security, and disaster response settings

Team Lead Presenter: Jon Carmack
Goal 5: Proposed Small, Modular Systems Prize Summary

Objective: Develop fuel-agnostic “energy-water in a box” solutions that are modular, portable, reliable, and cost effective

Why?
- Small, modular energy-water systems have the potential to serve areas where energy and/or clean water is scarce, expensive, or challenging to obtain, such as islands, rural areas, and communities affected by a disaster.
- But innovation is needed to improve the cost-effectiveness of linked energy-water systems and test performance in a range of use-cases.
- A Department-level prize across all applied energy offices could capture the public’s imagination, draw a range of innovators, and lead to ground-breaking new solutions.

Prize Structure and Features:
- Begin with a multi technology, ideation prize to identify promising concepts and business plans across 3 use cases: 1) Response and Recovery; 2) Water Scarce Developing Nations; 3) Remote and Island Communities. Prize outcomes would provide information to multiple DOE program offices and agency partners to plan future investments.
- Launch in FY 19/FY 20.

Sample Metrics (will vary by use case):
- Portability and speed to deploy
- Continuous operation with low maintenance
- Cost effectiveness

Goal 5 Team Representatives
- DOE Nuclear Energy
- DOE EERE
- DOE ARPA-E
- USAID
- DHS-FEMA

Presenter: Melissa Klembara
The Water Security Grand Challenge

• DOE’s $100-million Energy-Water Desalination Hub will focus on early-stage R&D for energy-efficient and cost-competitive desalination technologies for treating non-traditional water sources for multiple end-use applications.

• The Hub will be led by the National Alliance for Water Innovation (NAWI), a public-private partnership with more than 35 members and over 180 organizations led by Lawrence Berkeley National Laboratory in collaboration with National Energy Technology Laboratory, National Renewable Energy Laboratory, and Oak Ridge National Laboratory.

• NAWI will pursue distributed desalination and water use enabled by Autonomous, Precise, Resilient, Process-Intensified, Modular and Electrified (A-PRIME) water treatment technologies.

The Hub will address all 5 Water Security Grand Challenge goals.
