

# Catalysis for Plastic Upcycling

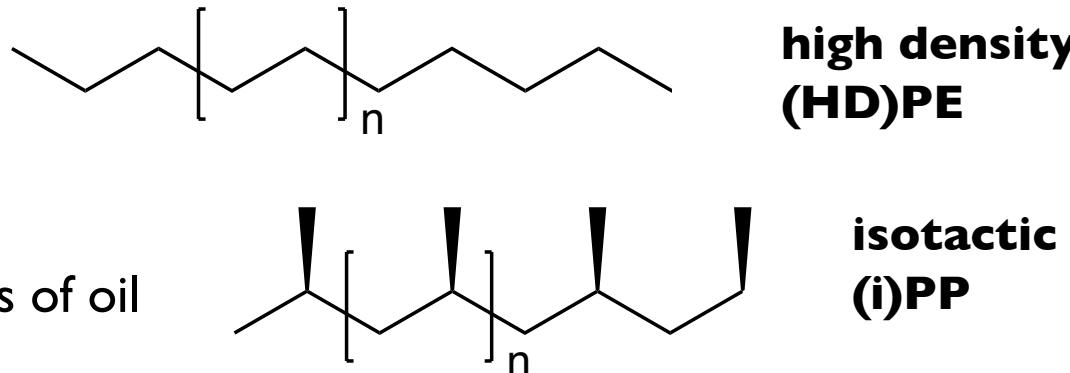

Aaron D. Sadow

Ames Laboratory and Iowa State University

[sadow@iastate.edu](mailto:sadow@iastate.edu)

# Mission: To create a new generation of catalysts that enable chemical upcycling of energy-rich macromolecules

- Plastics are an energy problem: production consumes an annual equivalent of 6-8% worldwide oil and LNG
  - Polymers generate 300 M tons of municipal solid waste (MSW) worldwide (2015)
  - Polyethylene (PE), polypropylene (PP), and polystyrene (PS) make up ~55% of this waste
- Polymer recycling is energetically and economically limited
  - Most plastics are designed for single-use applications (packaging)
  - Physical properties degrade in recycling or reprocessing
  - Most commodity plastics are highly engineered materials
- Upcycling (chemical conversion) should add value
  - Energy value of current PE + PP + PS waste  $\approx$  1.3 B barrels of oil
  - US consumes ~7.3 B barrels/year
