CHP Overview

DOE CHP Technical Assistance Partnerships (CHP TAPs)

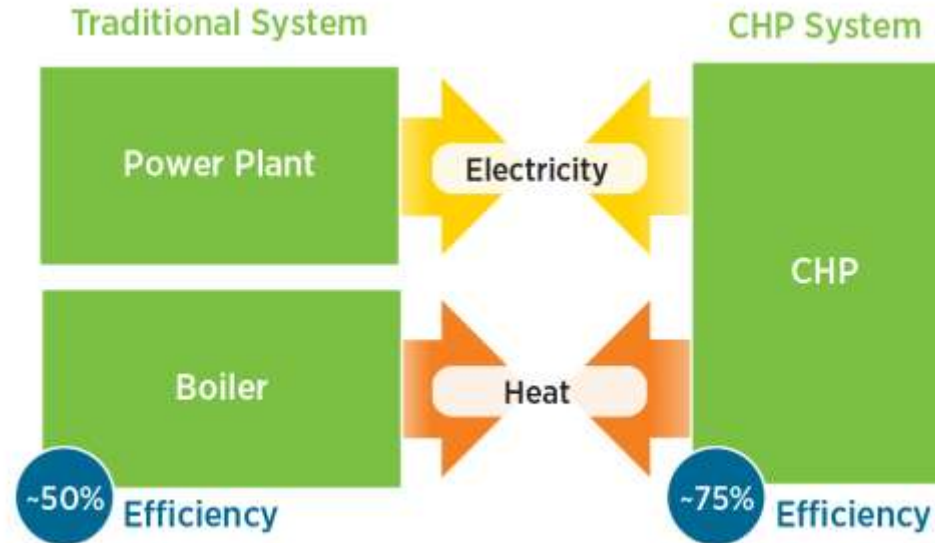

- **End User Engagement**
Partner with strategic End Users to advance technical solutions using CHP as a cost effective and resilient way to ensure American competitiveness, utilize local fuels and enhance energy security. CHP TAPs offer fact-based, non-biased engineering support to manufacturing, commercial, institutional and federal facilities and campuses.
- **Stakeholder Engagement**
Engage with strategic Stakeholders, including regulators, utilities, and policy makers, to identify and reduce the barriers to using CHP to advance regional efficiency, promote energy independence and enhance the nation's resilient grid. CHP TAPs provide fact-based, non-biased education to advance sound CHP programs and policies.
- **Technical Services**
As leading experts in CHP (as well as microgrids, heat to power, and district energy) the CHP TAPs work with sites to screen for CHP opportunities as well as provide advanced services to maximize the economic impact and reduce the risk of CHP from initial CHP screening to installation.

CHP: A Key Part of Our Energy Future

- Form of Distributed Generation (DG)
- An integrated system
- Located at or near a building / facility
- Provides at least a portion of the electrical load and
- Uses thermal energy for:
 - Space Heating / Cooling
 - Process Heating / Cooling
 - Dehumidification

CHP provides efficient, clean, reliable, affordable energy – today and for the future.

Common CHP Technologies and Capacity Ranges

What Are the Benefits of CHP?

- CHP is **more efficient** than separate generation of electricity and heating/cooling
- Higher efficiency translates to **lower operating costs** (but requires capital investment)
- Higher efficiency **reduces emissions** of pollutants
- CHP can also increase **energy reliability and resiliency** and enhance power quality
- On-site electric generation can **reduce grid congestion** and avoid distribution costs.

CHP Can Enable Other Microgrid Technologies

- With a CHP system providing baseload electric and thermal energy, microgrids can add:
 - Solar and wind resources
 - Energy storage
 - Demand management
 - Central controls
 - Electric vehicle charging
- Flexible CHP systems can ramp up and down as needed to balance renewable loads and provide grid services

How does CHP fit into a low carbon energy future?

- CHP is the most efficient way to use a fossil fuel
- Many CHP systems use renewable or waste fuels
- Distributed CHP on the grid can help support greater renewable integration

CHP Today in the United States

By Installations – 866 Installs
2014-2018

- **81.1 GW** of installed CHP at more than 4,500 industrial and commercial facilities
- 8% of U.S. Electric Generating Capacity; 14% of Manufacturing
- Avoids more than **1.8 quadrillion Btus** of fuel consumption annually
- Avoids **241 million metric tons of CO₂** compared to separate production

CHP and Multifamily

State of Multifamily CHP

Multi-Family CHP Installations Through 2019 - US

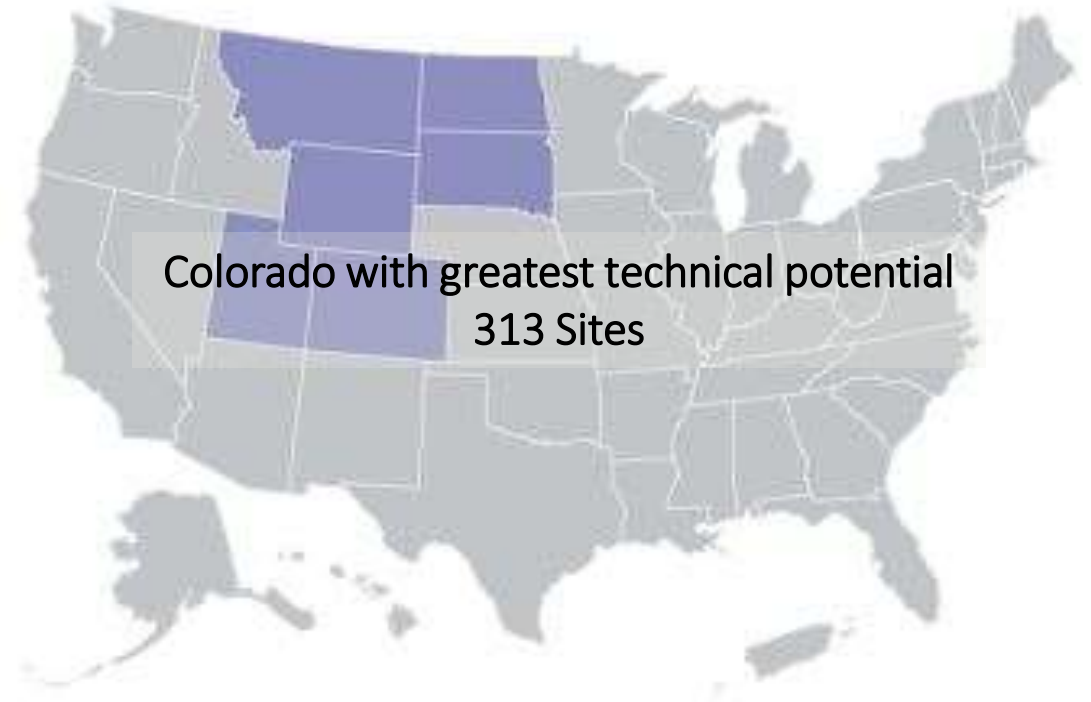

- 425 CHP Systems
- 158 MW
- Average size 371 kW
- Primary Fuel – Natural Gas
- Prime Mover – Reciprocating Engine
- Most Common Geography – New York and New Jersey

Source: DOE CHP Installation Database (U.S. installations as of December 31, 2018)

Why CHP May Work in Multifamily

- Why CHP Works in Multifamily:
 - Inherent market opportunity. Two of every 10 Americans live in a unit in a multifamily building.
 - Many of these buildings contain centralized energy systems that can incorporate CHP.
 - Multifamily buildings operate 24 hours a day, seven days a week, with a consistent need for both electricity, water heating, and space heating/cooling.
 - Benefits of resilient CHP. CHP can allow multifamily buildings to continue operation during utility grid outages, ensuring that critical loads at multifamily buildings stay operational, adding to quality of life for tenants.
 - Multifamily housing's disproportionately high energy use compared to other forms of existing residential construction. Although the dense spatial configuration of multifamily as compared with single-family housing would suggest its greater energy efficiency, the national data contradicts such an assumption. Multifamily buildings make up 18% of the total residential building stock but use 28% of the energy
 - High and stable demands for cooling. These buildings can be served using a CHP system with an absorption chiller that uses the heat from the CHP system to generate chilled water.

Deciding on CHP for Multifamily

- Is it a single building with 50 or more units? (There are examples of installations in smaller buildings.)
- Is it master metered for electricity? (If not, there is the possibility of switching to master billing from the utility with advanced sub-meters in the apartments that display the varying electricity rates, thus enabling occupants to schedule consumption and reduce their bills).
- Is there a central domestic hot water system rather than units in each apartment?
- Is it an all-electric building? These are good prospects for installing CHP

Source: https://www.epa.gov/sites/production/files/2019-05/documents/chp_multifamily.pdf

Sizing CHP Correctly

- **Sizing to average DHW loads enables efficient utilization of electricity and thermal energy.**
 - This strategy results in a relatively small CHP system, but can be applied to both master metered and direct-metered buildings with central water heating.
- **Common area electric loads are more consistent than tenant electric loads, and sizing to common area loads is a viable strategy, especially for direct-metered buildings**
 - Sizing to the average common area electric load (including exterior lighting and building operations) would result in relatively efficient CHP system operation, with thermal energy utilized for DHW and some space heating loads.
- **Sizing to full building electric loads increases the CHP size, which can result in improved performance and lower per-kW costs, but variable loads may lead to low operational efficiency.**
 - To avoid oversizing for winter months, avoid cooling loads when sizing the CHP system.

With loads for domestic hot water and non-cooling electricity remaining relatively consistent across climate zones, general rules of thumb for CHP sizing can be developed.

Improving Resilience

How Does CHP Increase Resilience?

- For end users:
 - Provides continuous supply of electricity and thermal energy for critical loads
 - Can be configured to automatically switch to “island mode” during a utility outage, and to “black start” without grid power
 - Ability to withstand long, multiday outages
- For utilities:
 - Enhances grid stability and relieves grid congestion
 - Enables microgrid deployment for balancing renewable power and providing a diverse generation mix
- For communities:
 - Keeps critical facilities like hospitals and emergency services operating and responsive to community needs

Design is Critical for Resilient CHP Systems

- Design criteria can significantly impact the resilience of CHP systems during severe weather events
- Key design considerations include:
 - Elevation of equipment above flood and storm surge levels
 - Utilize containerized or indoor systems to protect from high winds and debris
 - Utilize shock-mount systems enclosures in earthquake-prone areas
 - Equip with fire protection systems for above-ground gas delivery systems

The Texas Medical CHP system remained operational throughout Hurricane Harvey despite significant flooding in the Brays Bayou area (<https://www.energy.gov/eere/amo/articles/chp-installation-keeps-hospital-running-during-hurricane-harvey>)

What are the benefits of CHP in enhancing resilience for end users, utilities and communities?

Who Can Use CHP?
 Critical infrastructure sectors conducive to CHP. Host facilities must have a consistent electric and thermal demand, and a reliable source of fuel (pipeline natural gas, anaerobic digester gas, etc.)

Micro CHP and Applications

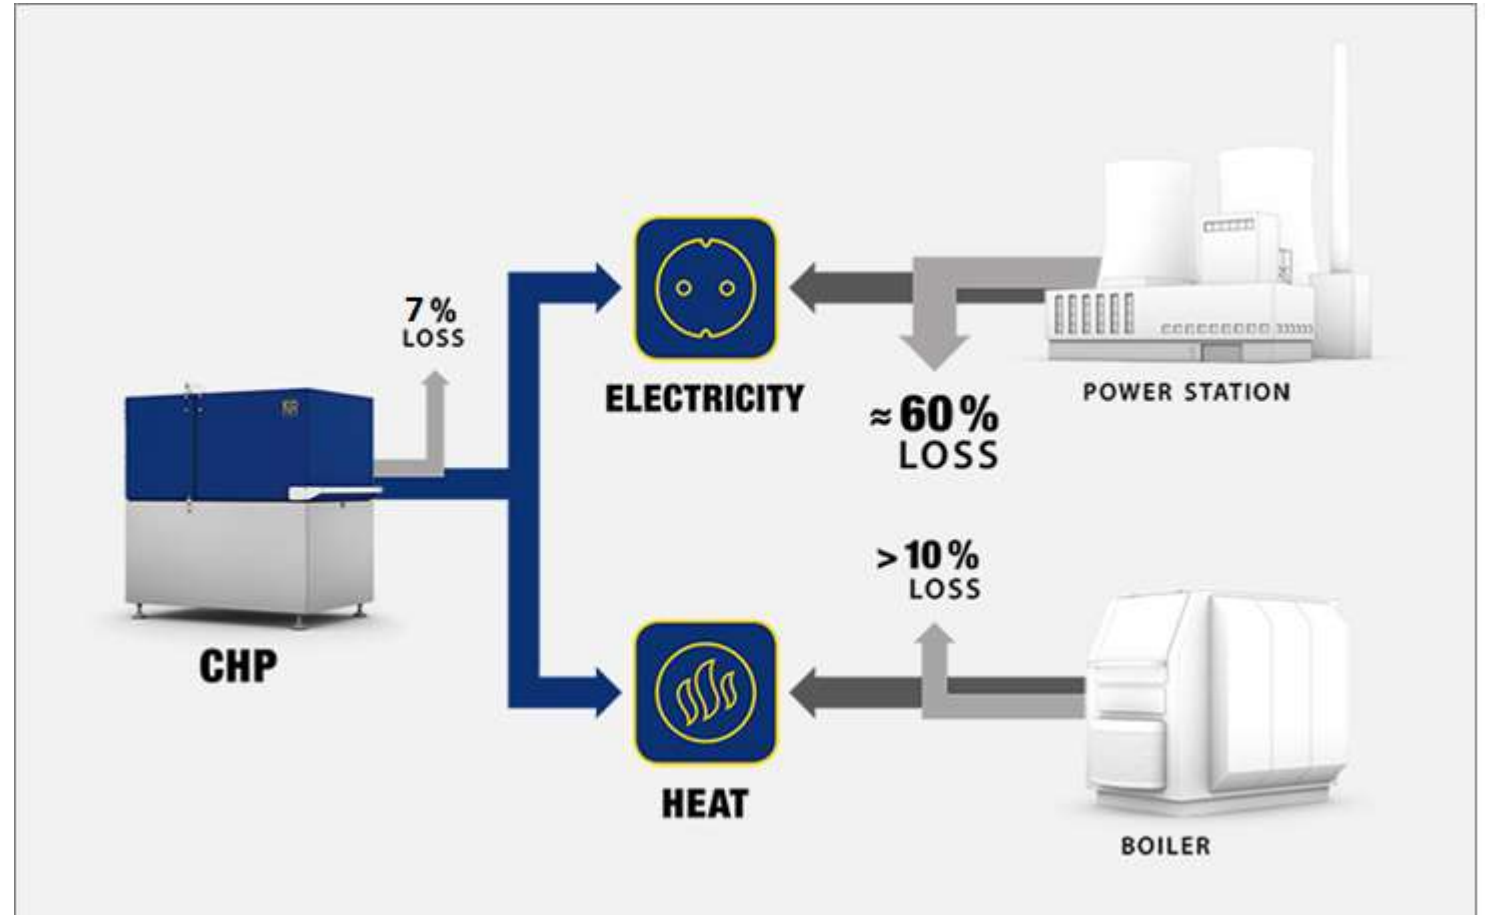

Micro CHP

What is μ CHP?

- **CHP** is the ability to produce heat *and* power from a single fuel source

- μ = **Micro** (<50kW)
- **C** = **Combined**
- **H** = **Heat**
- **P** = **Power**

Why Lochinvar CHP?

- Electric production efficiency: 31%
 - No transmission losses
 - Power produced on-site
- Heat production efficiency: 62%
 - Heat is utilized for producing hot water
- Total efficiency: 93% (LHV)
- Reduce Demand Charges
 - Electricity produced at low NG rate
- Reduced greenhouse emissions
 - Clean burning NG with stoichiometric combustion

Why CHP?

- **Demand Charges**
 - The hidden cost in commercial power bills
- Typically based on 15 minute intervals
- Can account for up to 50% of a facilities power expenditures
